

The gloriest hole of them all.

The challenge: I really dislike the way women are super exposed when using a female glory hole like they don't get the same level of privacy and safety that men do when using a normal glory hole. Like if a man wants to bail from a glory hole he just pulls out and boom while women have to extricate themselves from a complicated rigging setup that won't allow them to get out in a hurry. I also wanted to allow them to have a way to ensure through physical design that they can only receive oral sex and prevent someone from penetrating (PIV) them against their wishes. What I ended up with was a ungodly homunculi of a queening chair + angled tattoo/massage chair + horse saddle + and a coffin. Ps I was very drunk when I cooked this up I don't remember why I used non gendered terms for the rest of this text. (Tbh it's fine bc like sure most ppl with a dick are men, most ppl with a vulva are women but sometimes it ain't that way so idk just take a shot of 190 everclear and chill out).

It's basically an 8-9 page drunken rant with some drawings in it.

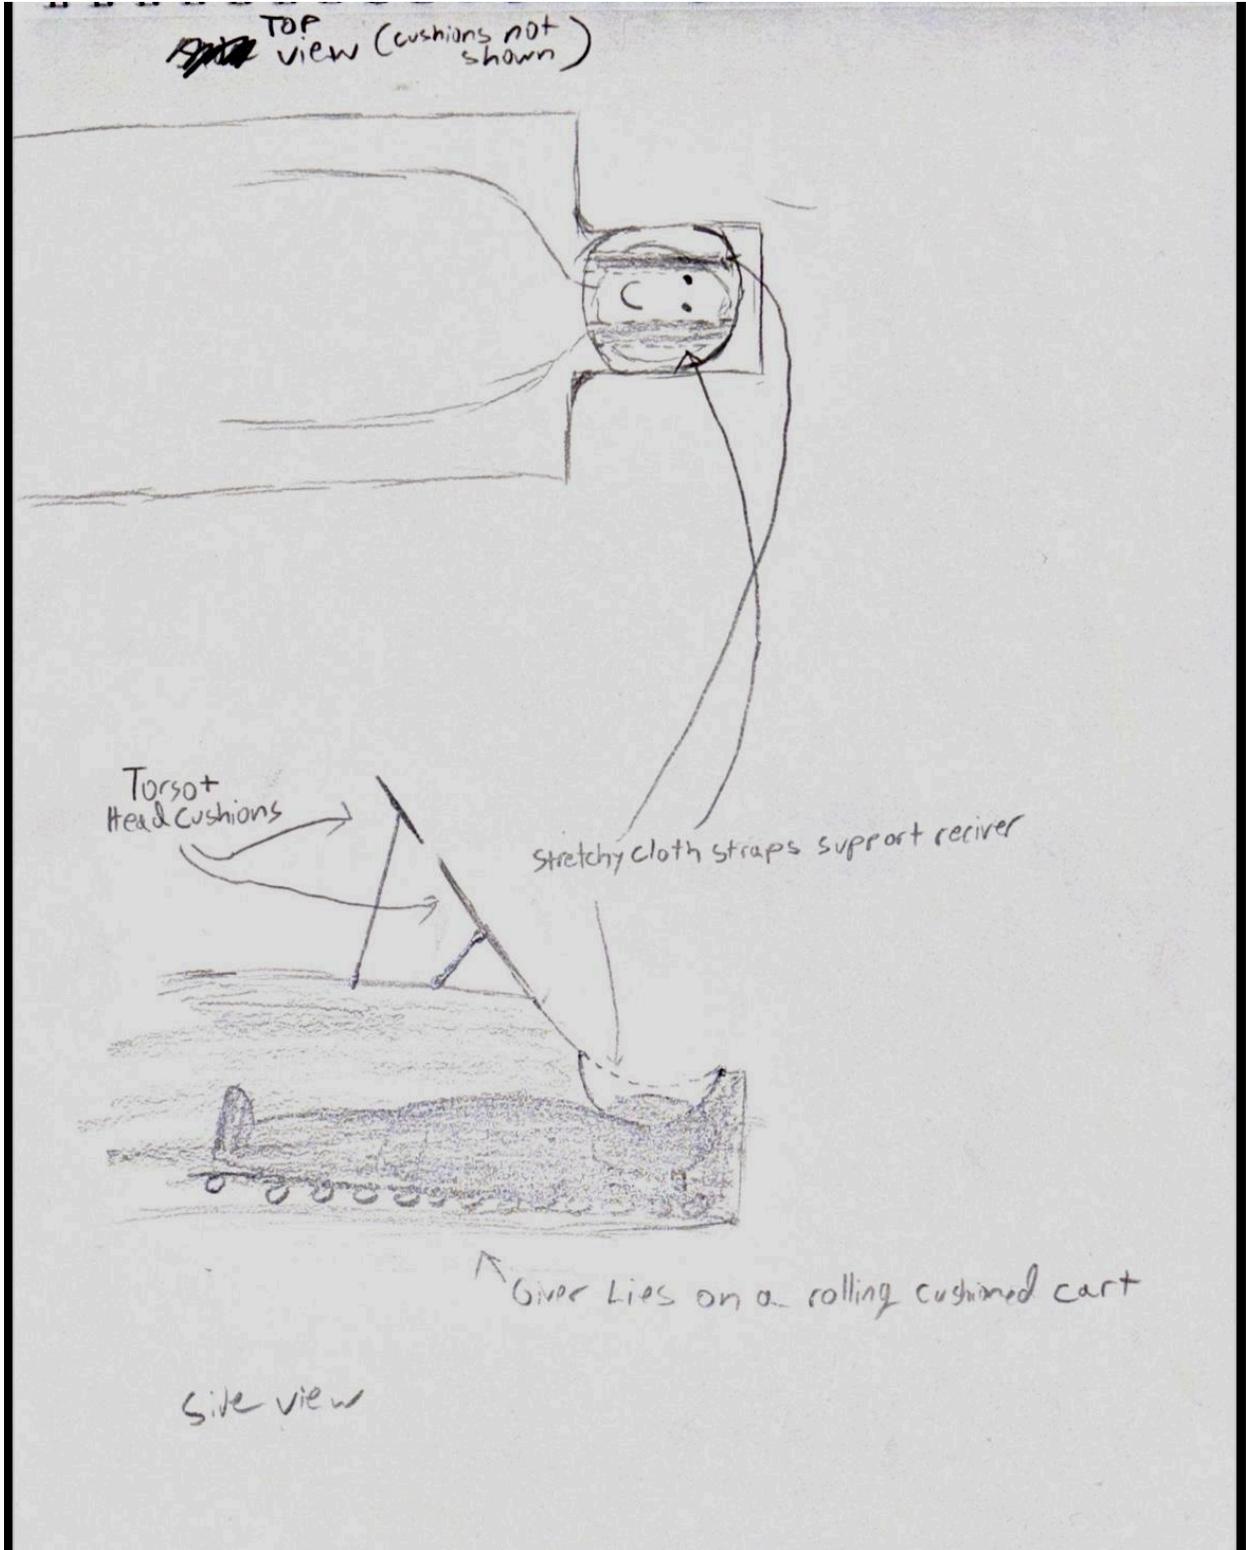

I'm horrible at designing around and drawing human bodies from scratch so I cheated. I took a side view photo of me giving a large sized empty trash bin (big enough to fit my head comfortably inside) the ride of its life as a stand in for the seat/hole area of my design.

I then traced my body off my phone using some carbon paper I had lying around. And I also drew some of the basic lines and angles of the glory hole around the traced sketch of my lower body

Please note that I do not have the right parts for the intended purpose of the hole so I made a best guess estimation on where a vulva would lie on my body if I had one and how I'd position myself on the glory hole when I designed the angles of how someone would use it.

From that initial sketch I designed simple sketches of side and top views of the glory hole.

Tbh it's more like a glory sarcophagus 😞.

It uses the lying on ur belly at an angle concept from a tattoo chair to allow the receiver to present a better angle of access to the vulva. Additionally the hole is purposefully oversized as it doesn't actually support you. Instead you sit on two stretchy elastic fabric bands running parallel to the vulva that allow you to control how far down you are on the giver's face without having to squat all your weight on either your knees/legs. Please note that the straps should be wider than shown in the drawing.

This is concept is taken shamelessly from a popular type of face sitting chair so I'm reasonably sure it will work.

I didn't bother drawing it in but you can optionally attach a washable loose fabric material that covers the gap from the side of the hole to the outside edge of the straps leaving only the gap between the inside edges of the straps accessible to maximize privacy while still letting the thighs have range of motion. Personally I think this isn't that necessary but it's an option.

As for safety the receiver simply needs to stand up to move out of range of the giver if something goes wrong. Additionally the area where the head sits below the hole is too small to fit the pelvic area of the body so the giver is physically incapable of maliciously initiating PIV sex. I seriously doubt this would happen at [my college] but it pays to be safe.

Both giver and receiver are in comfortable supported positions.

Operation:

-the giver enters a sort of private waiting room (could just be sectioned off with plywood or heavy curtains from the main room if it's not a actual separate room) which is attached to the other end of the "giving" area under the hole and angled cushion mounts.

-the giver cannot enter the giving area as the door/hatch is electronically locked.

-the receiver enters their side of the glory area and assuming a comfortable position with the exception of not sinking down fully on the straps. Instead they temporarily hold themselves up with their legs putting little to no weight on the straps.

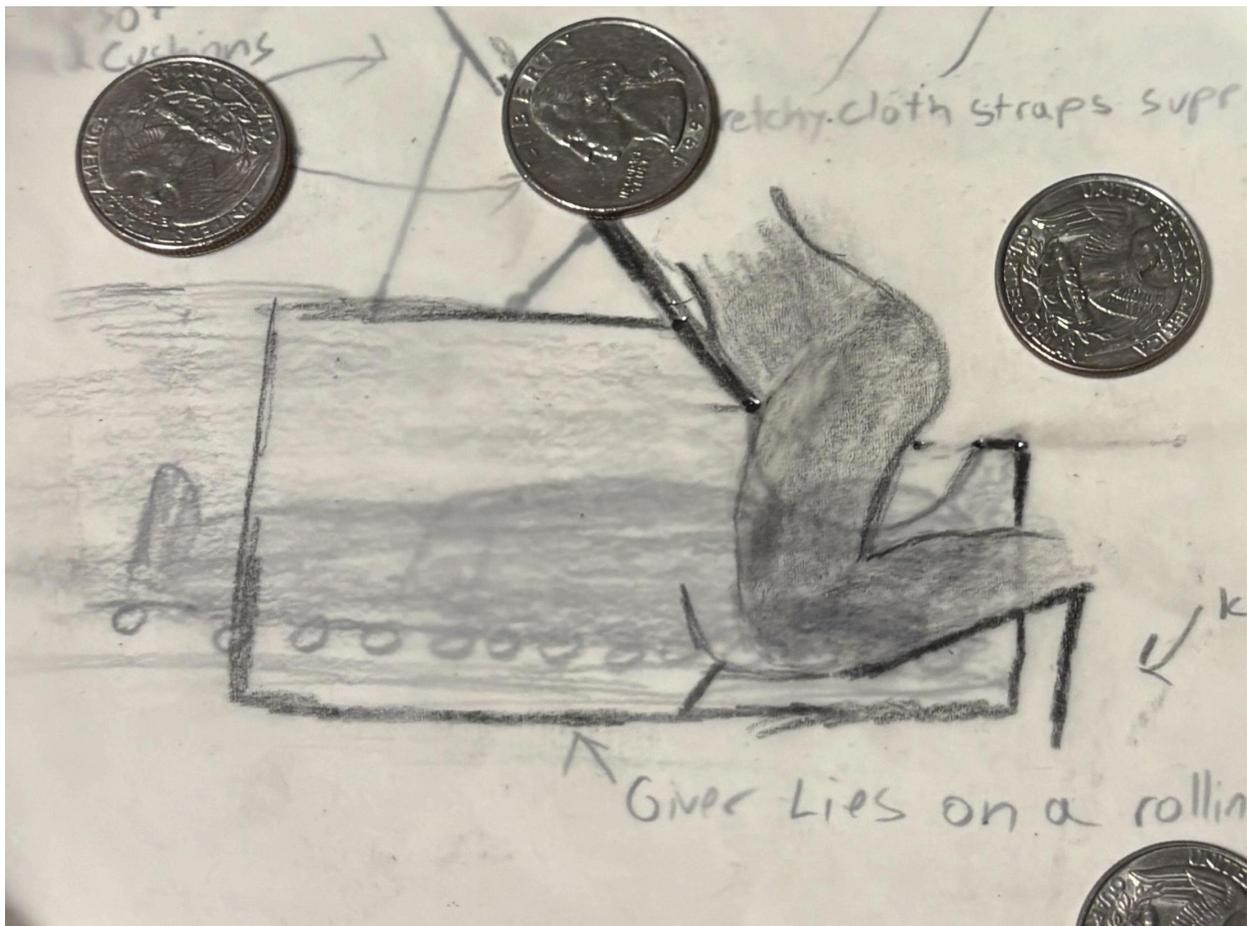

-the receiver then pushes a ready switch unlocking the door and allowing the giver to slide themselves into position under the hole

-neither party has the opportunity to see the other party during this sequence.

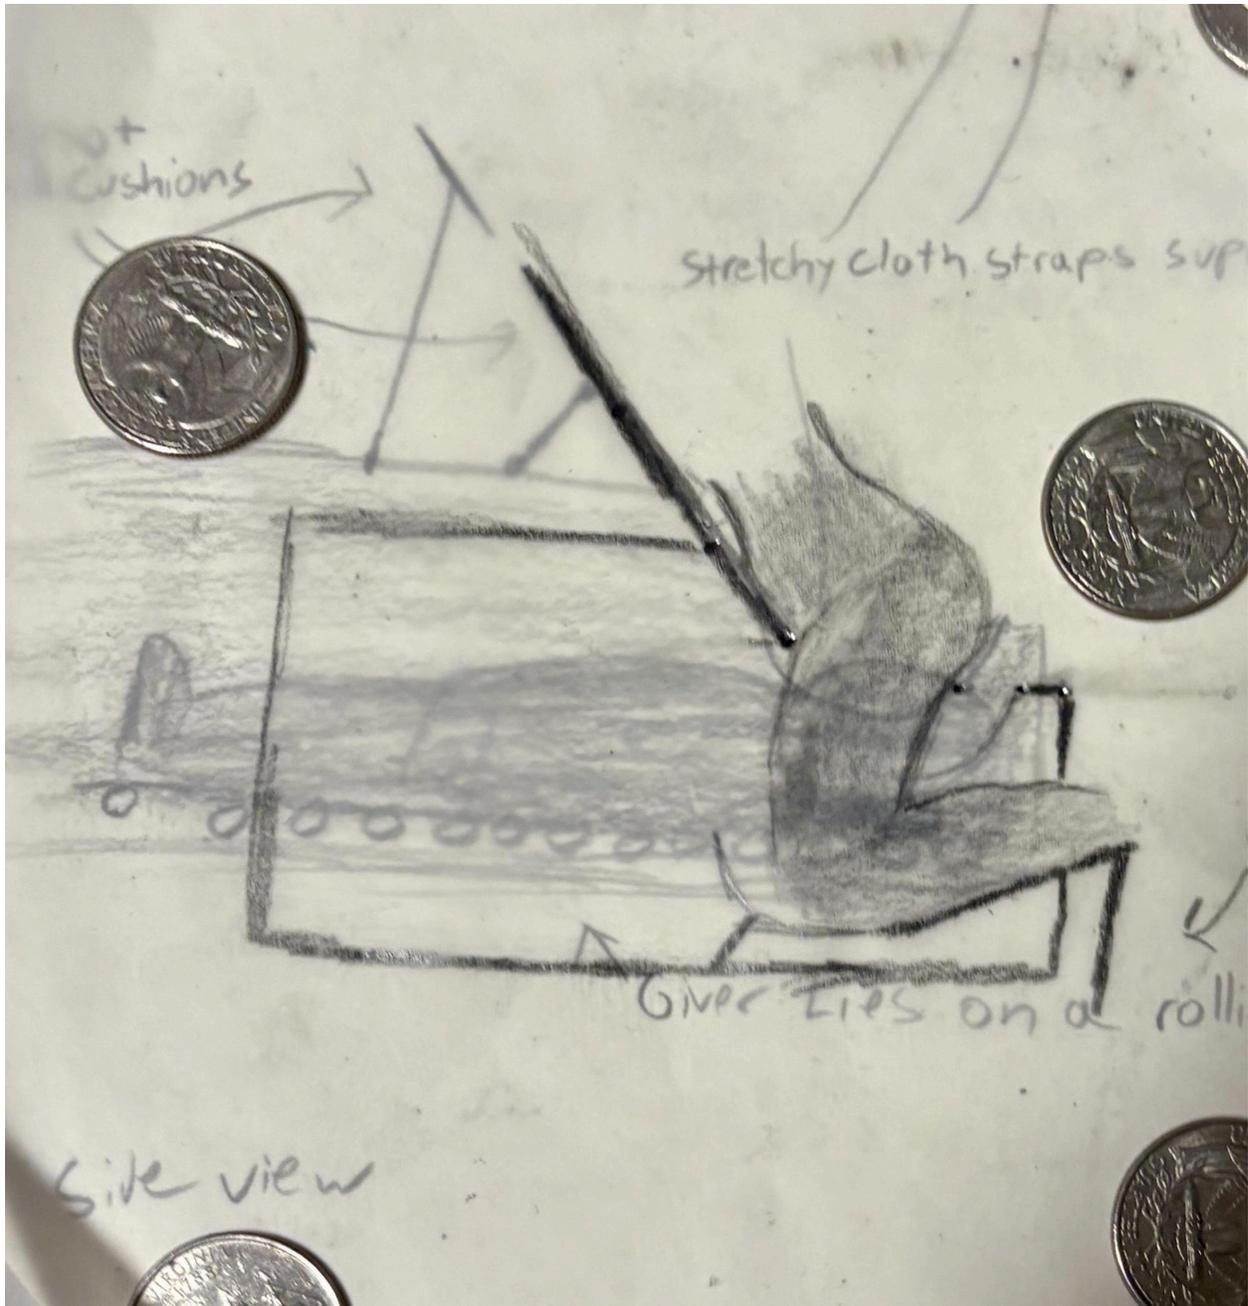

-the giver pushes their own ready switch which through an audio visual cue of some sort lets the receiver relax down into the straps and sink into an accessible position for the giver

-alternately instead of the receiver hovering the straps could be rigged up with electric ratchets that start out pulling the straps taught so the receiver cannot sink down into the hole yet and only when the giver pushes their ready switch does it allow the straps to relax letting the receiver sink down onto their face. The receiver can also, using a simple dial interface, adjust how much slack is in the straps to control how deep they want to sink onto the giver without exerting their muscles at all.

The carbon paper allows me to actually demonstrate the positioning by overlaying it with the side view blueprint.

Above: receiver is hovering above hole
Below: receiver is fully sunk down onto the giver.

-oral sex happens

-after a preset time elapsing or one party tapping out the receiver lifts off the giver retiring to the hovering position (and if installed the electric ratchets would lift them up on their own to the hover position)

-the receiver may dismount and leave at this point but it's recommended they remain in the hover position until the giver has left the giving area and shut the door to prevent them from catching a glimpse of the receiver through the hole.

And that's basically it yayyyy!!! There's probably a simpler way that I totally didn't think about, but it was a cool engineering exercise none the less and it evens the odds for glory hole sex.

How it feels to get fancy with carbon paper:
