Breach : true

Name : MGM Resorts (2022 Update)

Website : mgmresorts.com

Bio : In July 2019, [MGM Resorts discovered a data breach of one of their cloud services](https://www.zdnet.com/article/exclusive-details-of-10-6-million-of-mgm-hotel-guests-posted-on-a-hacking-forum/). The breach included 10.6M guest records with 3.1M unique email addresses stemming back to 2017. In May 2022, [a superset of the data totalling almost 25M unique email addresses across 142M rows was extensively shared on Telegram](https://www.vpnmentor.com/blog/mgm-leaked-on-telegram/). On analysis, it's highly likely the data stems from the same incident [with 142M records having been discovered for sale on a dark web marketplace in mid-2020](https://www.zdnet.com/article/a-hacker-is-selling-details-of-142-million-mgm-hotel-guests-on-the-dark-web/). The exposed data included email and physical addresses, names, phone numbers and dates of birth.

Breach : true

Name : Not Acxiom

Bio : In 2020, <https://www.troyhunt.com/data-breach-misattribution-acxiom-live-ramp/> a corpus of data containing almost a quarter of a billion records spanning over 400 different fields was misattributed to database marketing company Acxiom and subsequently circulated within the hacking community. On review, Acxiom concluded that "the claims are indeed false and that the data, which has been readily available across multiple environments, does not come from Acxiom and is in no way the subject of an Acxiom breach". The data contained almost 52M unique email addresses.

Breach : true

Name : Verifications.io

Website : verifications.io

Bio : In February 2019, the email address validation service <https://securitydiscovery.com/800-million-emails-leaked-online-by-email-verification-service> verifications.io suffered a data breach. Discovered by <https://twitter.com/mayhemdayone> Bob Diachenko and <https://twitter.com/vinnytroia> Vinny Troia, the breach was due to the data being stored in a MongoDB instance left publicly facing without a password and resulted in 763 million unique email addresses being exposed. Many records within the data also included additional personal attributes such as names, phone numbers, IP addresses, dates of birth and genders. No passwords were included in the data. The Verifications.io website went offline during the disclosure process, although <https://web.archive.org/web/20190227230352/https://verifications.io/> an archived copy remains viewable.
