Chapter 1

INTRODUCTION

Conventional EMUs use DC traction motors which are directly connected to the rectifier. The current trend for last decade is to move from DC traction motors to AC traction motors, which offer better control, better reliability and are less prone to breakdown and repair.

In this regard, RDSO has released specification no. RDSO/PE/SPEC/EMU/0096-2008 (Rev. 04) for producing 3-phase drive propulsion equipment for AC EMUs. ICF proposed to design Trainset with 50% motoring with all power components underslung. This trainset has coach with sitting arrangement. Coach in configuration is of different type such as driving AC chair car, AC chair car and executive AC chair car.

1.1 List of Abbreviations used

Acronym	Description
AC	Alternating Current
ACU	Auxiliary converter Unit
ADC	Analog to Digital Converter
AIP	Analog Input
ATC	Auxiliary Traction Converter
BC	Brake Cylinder
BCP	Brake Cylinder Pressure
BE	Braking effort
CAN	Controlled Area Network
CCU	Coach Control Unit.
DC	Direct Current
DCS Key	Driver control Switch Key
DE	Driving End
DE	Driving End
DIP	Digital Input
DOP	Digital Output
DPRAM	Dual Port Random Access Memory
DSP	Digital Signal Processor
DTC	Driving trailer coach
EBCU	Electronic Brake Control Unit
EBL	Emergency Brake Loop
ECN	Ethernet Consist Network
ED	Electro Dynamic
EEPROM	Electrically Erasable and Programmable Read Only Memory
EMU	Electrical Multiple Unit
EOL	Emergency Off Loop
EP	Electro Pneumatic

Acronym	Description
EPCC	Enhanced Passenger comfort computer
EPCU	Enhanced Passenger comfort unit
FDP	Fault Data Pack
HWTL	Hard Wired Train Line
AC	Alternating Current
ACU	Auxiliary Converter Unit
BE	Braking effort
DSP	Digital Signal Processor
DTC	Driving trailer coach
HSCB	High Speed Circuit Breaker
ICF	Integral Coach Factory, Chennai
LED	Light Emitting Diode
MC	Motor Coach
MSDPL	Medha Servo Drives Pvt. Ltd.
PA PIS	Passenger Announcement and Passenger Information System
PWM	Pulse Width Modulation
RDSO	Research Development and Standards Organization
TC	Trailer Coach
TCMS	Train Control and Management System
TE	Tractive Effort
TM	Traction Motor
TSA	Traction system Austria
AWS	Auxiliary warning system
CAN	Controlled Area Network
CCU	Central Control Unit
DC	Direct Current
DE	Driving End
ED	Electro Dynamic
EP	Electro Pneumatic
HWTL	Hard Wired Train Line

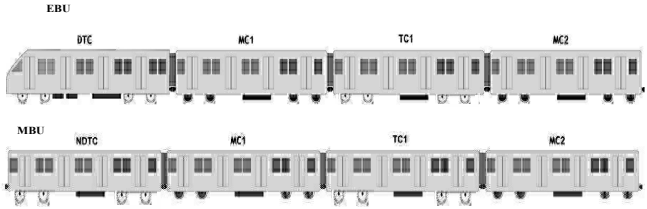
Abbreviation	Description
LTC	Line and Traction Converter
LTCU	Line and Traction Converter Computer
MAK	Medha Kolkata Metro
MCU	Main Control Unit
MVB	Multifunction Vehicle Bus
NDE	Non Driving End
NDTC	Non Driving Trailer Coach
PCC	Passenger comfort computer
PS	Power Supply
RDM	Rescue Drive Mode
TC	Trailer Coach
TCN	Train communication network
TIC	Traction Inverter Computer
TM	Traction Motor
USB	Universal Serial Bus
WTB	Wire train bus

Chapter 2

SYSTEM OVERVIEW

One basic unit of 4-car unit is the building block for Train 18 rake formation. Each basic unit consists of one Driver Trailer Coach (DTC) at the end, two Motor Coaches (MC) and one Trailer Coach (TC). Each middle basic unit consists of Non driving Trailer Car (NDTC), two motor car (MC) and one Trailer Car (TC).

Four such basic units are coupled together to form one rake of 16 cars:



2.1 Driving Trailer Coach (DTC)

DTC is a non-powered vehicle with a driver cab at one end. The driver cab is furnished with a pre-fabricated driver desk. All driving operations are possible from this driver desk. Feedback from the system in all the coaches/ basic units is available for viewing by motor man on the driver desk. In this regard, CCU aggregates the information from all the coaches and a 10.4" TFT driver display screen provides information to motor man. Further an illuminated indication panel is provided for important driving related information for quick viewing by motor man. Various gauges are also provided for viewing MR, BP, BC pressure. Motor man can also control the passenger information system from the driver desk DTC. Apart from the driver cab is called as passenger saloon area. Passenger saloon area is similar to trailer coach, except the space occupied by driver cab.

DTC also consists of battery box, battery charger and compressor which are mounted underslung. Rest of the DTC apart from the driver cab is passenger saloon area which consists of pantry, RMPU control unit, mono block pump controller, CRW, GCRW panel and various end wall panels. It is a air-conditioned coach. All passenger comfort related load are controlled by driver from driver cab.

2.2 Motor Coach (MC)

MC is a powered vehicle with one traction motor driving each axle. The motor coach consists Line and Traction Converter Unit (LTC) for each Bogie mounted underslung.

Also Brake chopper resister is mounted underslung. Transformer secondary cable for both LTC unit from power transformer come from Trailer Coach through underslung mounted IV Coupler. It also consists of passenger saloon area, pantry, RMPU, mono block pump controller, electrical cabinet and various end wall panels. It is air-conditioned coach. The passenger saloon area is similar to trailer coach.

2.3 Trailer Coach (TC)

TC is a non-powered vehicle with only a passenger saloon area. The passenger saloon area includes lights, fans, emergency lights, air handling unit (for ventilation), and passenger information system consisting of LED displays and speakers (for announcements).

TC consists of a pantograph, vacuum circuit breaker and HV isolator on roof. it also consists of auxiliary converter unit and power transformer mounted undeslung. Power to LTC units of both motor coaches is distributed from same power transformer.

2.4 Non Driving Trailer Coach (NDTC).

NDTC consists of passenger saloon area, pantry, RMPU, mono block pump controller, electrical cabinet and various End wall panels. It is a air-conditioned coach.

Non Driving Trailer Coach (NDTC) is similar to DTC except driver related interface. It also consists of battery box, battery charger and compressor mounted underslung. It also consists of passenger saloon area which consists of

pantry, RMPU control unit, mono block pump controller, and various end wall panels. It is a air-conditioned coach.

Chapter 3

SAFETY FEATURES

3.1 Particulars of the Train

Table 3.1 gives the leading particulars of EMU stock, on which supplied equipment is fitted.

Track gauge	1,676 mm
Coach length over body	23,100 mm
Max. width over body side	3,240 mm
Maximum permissible axle load (any coach)	17.00 tonnes

Table 3.1

Table 3.2 gives data about EMU coach formation.

Number of Coaches in Basic Unit	4 per basic unit
Train formation	16 coaches
Maximum Service Speed	160 km/ hr
Maximum Test Speed	176 km/ hr
OHE Line Voltage	25kV AC, 50 Hz
Variations in OHE Line Supply	Normal variation: 19 kV to 27.5 kV Occasional max (cut-off): 30 kV Occasional min: 16.5 kV Cut off voltage: 16 kV Frequency variation: 46 Hz to 54 Hz

Table 3.2

Operating climatic conditions for EMU Coaches:

Temperature Range	-5ºC to 50ºC Average Annual Ambient of 35ºC
Altitude	Coastal Area (Sea Level)
Rainfall	Very Heavy (up to 2500 mm during rainy season)
Water flooding	Max speed of 8 km/ h in water up to 203 mm above rail level with wave effect
Relative Humidity	Up to 98% during rainy season which last 5 months

Table 3.3

3.2 Train Propulsion Characteristics

3.2.1 With Axle Hung Fully Suspended Motor for EMU

- **Tractive effort and braking effort curves**

Based on the acceleration, deceleration and other requirements of the specification, the following tractive effort and braking effort curves are arrived. Below is the tractive effort and braking effort curve (electrical) Vs speed per MC of the EMU.

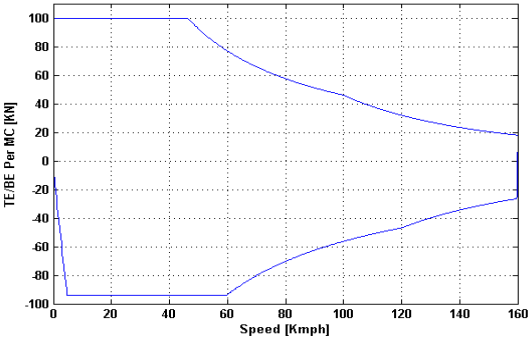


Fig 3.1 Tractive Effort vs speed curve

The braking effort of EMU is a total sum of electrical (regenerative) and electro-pneumatic braking efforts. Fig. 3.2 is the graph of Electrical (regenerative) braking effort and total braking effort (including Electro-pneumatic braking effort) along with TE. The difference between the two graphs is the electro-pneumatic braking effort that is required at different speeds.

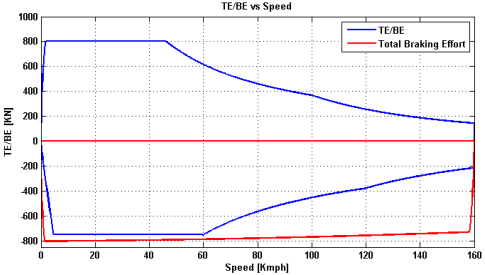

Fig 3.2 TE & Regenerative Braking Effort and Total Braking Effort (including EP Brake) for maximum braking operation for 16-car rake

Chapter 4

DRIVER DESK LAYOUT EQUIPMENT

Driver Desk is provided in driver cab for user interface. All equipment such as switches, lamps, master controller, DDU, PIS interface which are required for driver interface are mounted on driver desk. Layout of equipment are given in below sections.

4.1 Driver Desk overview

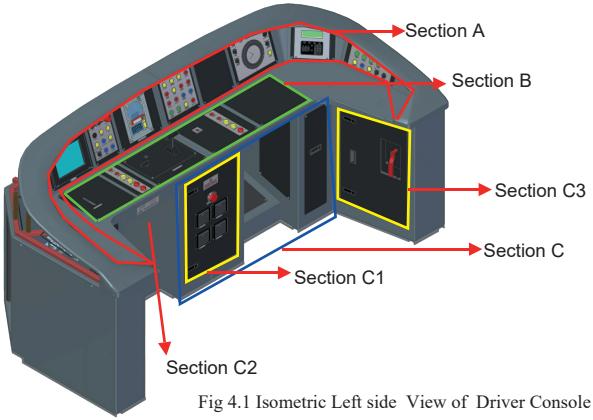

Fig 4.1 Isometric Left side View of Driver Console

Driver's cab is for motor man and guard. The left-hand side of the driver's cab is the workstation for the motor man. The operation switches, lamps, gauges displays which are used motor man during driving are provided in front of motor man. The right-hand side is designed for the guard.

Chapter 5

DRIVER DISPLAY UNIT (DDU)

TCMS DDU provides information for the TCMS system to support motor man in operating rake while normal operation, as well as in case of malfunction of a subsystem.

DDU supports the maintenance staff in setting basic system parameters and fault finding. In case of failure of TCMS DDU, train can still be operated. There is one DDU installed in each DTC cab.

DDU communicates with TCMS and performs the following basic functions:

Provide an interface to control train functions

- Display operational status of train functions
- Display diagnostic events

There are two user groups:

- Driver ID and
- Maintenance ID

These IDs and corresponding user names can be configured (add or remove) through Medha configuration software.

5.1 Menu Description

5.1.1 Head line area

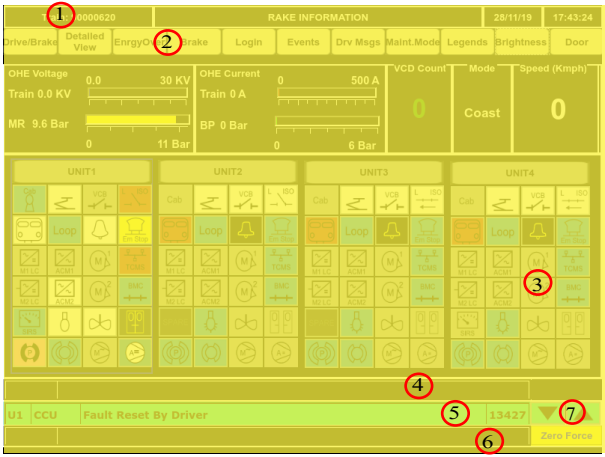

Fig. 5.1

Screen layout consists of 7 sections which are described below:

5.1.1.1 Section 1 - Head line area

Head Line area gives the information about train number configured, screen heading, date and time fields.

5.1.1.2 Section 2 – Soft key buttons area:

The soft key button area contains 10 touch sensitive buttons for different menu entries.

5.1.1.3 Section 3 – Main Screen area:

The main screen area shows the actual content of the selected screen. If required, further touch sensitive buttons are shown in the main screen area.

5.1.1.4 Section 4 - High Priority Message field:

Active diagnostic events which require acknowledgement by motor man are present in high priority message field area. For each event, the source of the event (basic unit number) and its event text are displayed along with an acknowledge button. If no such event is present, the text field and acknowledge button are not displayed. The events are presented in the order of their time of occurrence, across all event sources. When the acknowledge button is pressed, the respective event is acknowledged and disappears from this area. Clicking on the event is available at events list.

5.1.1.5 Section 5 - Scrolling Events area:

All pending active events are presented in scrolling events area in a scrolling pattern. For each event, the source of the event (basic unit, module details) and its event texts are displayed. If no such event is present, the text field is not displayed. Motor man can manually scroll up and down the list with the provided scroll buttons.

5.1.1.6 Section 6 - Pop up Messages area:

Pop up messages area is used to show informative (Popup) messages to motor man depending on the operational status of the train. If no popup message is pending, the area shall be blank.

5.1.1.7 Section 7 - Vmax area:

Vmax area indicates the maximum available/ allowed speed of the train. If traction interlock condition is detected by CCC, then ‘Zero Force’ appears in this area.

Table 5.1 gives the information of color significance of different symbols.

TYPE	ICON	FUNCTION
Type 1		Ready, Released for operation
Type 2		Fault communication
Type 3		Displayed, OFF
Type 4		MCB tripped
Type 5		Manual isolated or blocked for operation
Type 6		Alarm
Type 7		Warning
Type 8		ON or pressure OK
Type 9		Special status
Type 10		Empty Spare

Table 5.1

5.1.2 DDU screen views

5.1.2.1 Train level view

Fig 5.2 shows the train level view of DDU. Rake level, all the important symbols (basic unit wise), OHE voltage, OHE current, train speed, and train operational mode information are displayed here.

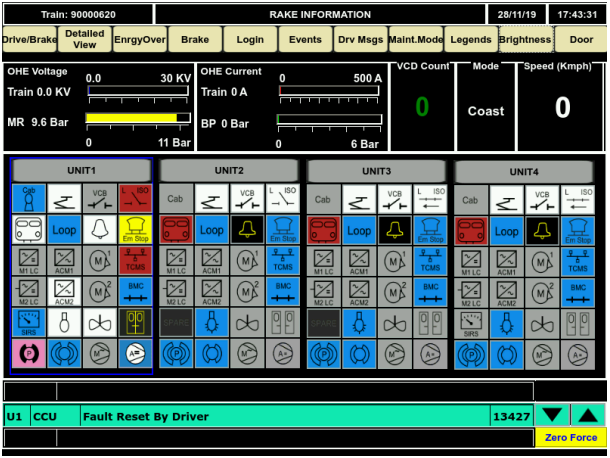

Fig. 5.2

5.1.2.2 Basic unit view

Basic unit view shows a graphical representation of the front basic unit, which consists DTC, MC1, TC, and MC2 cars. It provides a status overview of the major systems in the coaches. Fig 5.3 shows DDU front view for Basic unit 1.

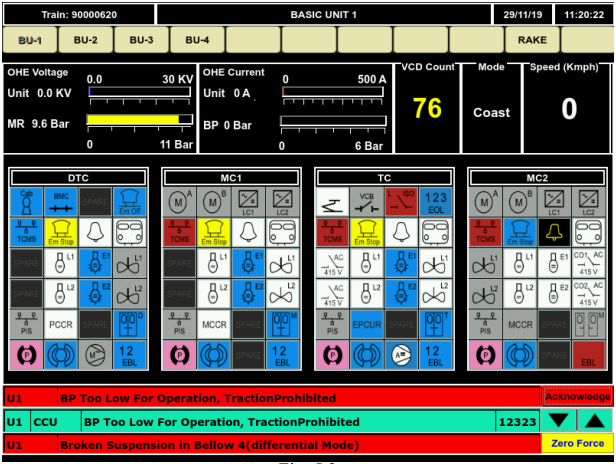

Fig. 5.3

5.1.2.3 Drive/ Brake view

Drive/ Brake view screen shows the OHE line voltage, current as well as traction effort values for each basic unit in the train. The small triangle type indicator indicates the set value for tractive/ braking effort, as percentage of the maximum available tractive/ braking effort. The set value is calculated by the function that distributes the desired efforts across the available basic units as a function of available traction systems, basic unit weight and other parameters. Consequently, at a given position of the master controller, the set values for different basic units can differ.

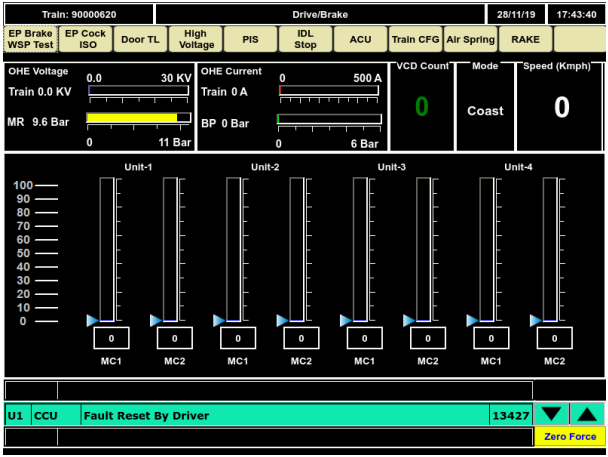

Fig. 5.4

The large level graph and the value beneath indicate the achieved total tractive/ braking effort as percentage of the maximum available tractive/ braking effort. The bar graph and value shown in orange color gives information about braking effort whereas the blue color gives information about tractive effort. The maximum available tractive and braking effort is dependent on the weight and speed of a basic unit.

The braking efforts are combined values for electrical (ED) and pneumatic (EP) brakes. The solid bars in each basic unit show the actual (achieved) traction/ braking effort values. The actual achieved value is displayed in the label

below the solid bars for each basic unit as shown in Fig 5.4.

5.1.2.4 Air Spring Overview Screen

Air Spring Overview screen gives information about bellow wise air suspension pressure values (in bars), end basic unit MR, and BP pressure values (in bars). The sensor healthiness information is displayed in color decoding of sensor name field. In case of sensor failure, corresponding value is shown in X, color of name field shall be differed. Basic unit level navigation can be possible through 'BU-x Suspension' soft key. Sensor name field color coding is shown below:

Background Color	Information
Airspr Bellow x (Blue)	Sensor healthy and within Range
Airspr Bellow x (White)	Sensor faulty
Airspr Bellow x (Yellow)	Sensor value showing out of range
Airspr Bellow x (Black)	Sensor override from DDU
Airspr Bellow x (Red)	Air Spring Suspension failed
Airspr Bellow x (Grey)	Sensor Status Isolated by System

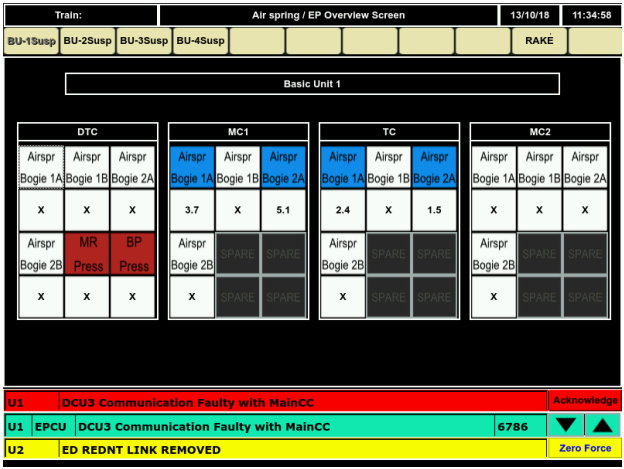

Fig. 5.5

5.1.2.5 Energy Overview

Energy Overview screen, shown in Fig 5.6 displays the energy consumption and energy regeneration values for each basic unit and for the whole train. It also displays the total distance traveled by train. Energy details of each basic unit is available in cumulative and trip wise.

Trip wise data is available for latest entered driver ID. Trip can be reset by using store track option in energy overview screen or by entering a new user ID from login screen.

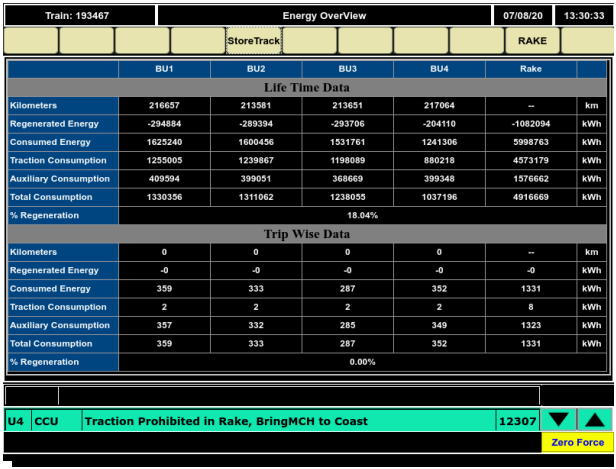

Fig. 5.6

5.1.2.6 Login Screen

Login screen, shown in Fig 5.7 is used to enter new user ID or to logout from existing user. Driver ID can be logged out using reset ID/ logout button. This screen is available only in occupied cab. User can change the train number from this screen.

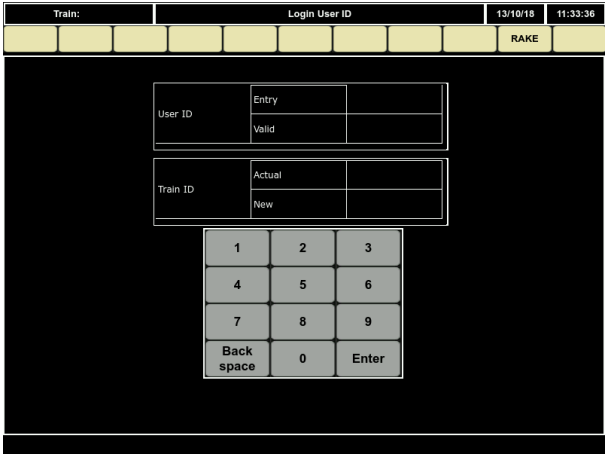

Fig. 5.7

5.1.2.7 Events Screen

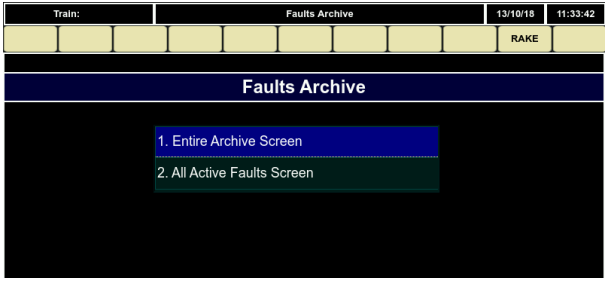

Fig. 5.8

Faults/ events are categorized into two types:

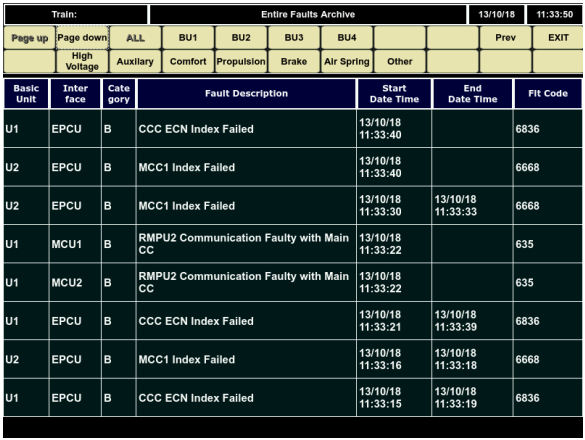

Fig. 5.9

- Entire fault Archive Type – It consists of all logged events along with recovery details.
- Active Fault Archive Type – It consists of only the present active faults information.

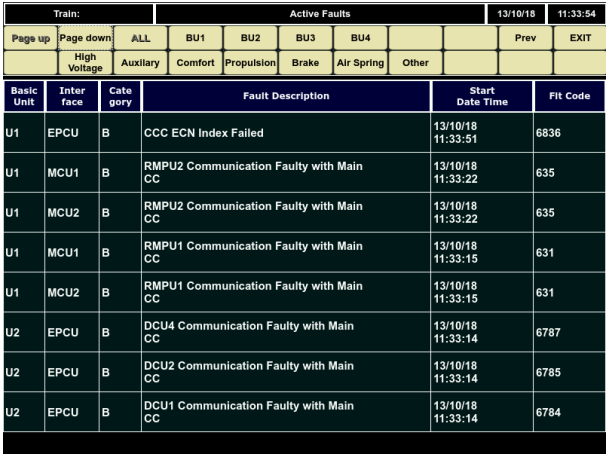

Fig. 5.10

All faults screen gives information about fault description, start time, end time (if recovered), basic unit number, and module information along with fault category.

In case of all active fault screen, same information is available except ‘End Time’ column.

5.1.2.8 Driver/ Crew Messages Screen

Driver Messages screen, shown in Fig 5.11 displays only the active fault/ event information which is required for motor man. HMI fault reset option is also available in this screen.

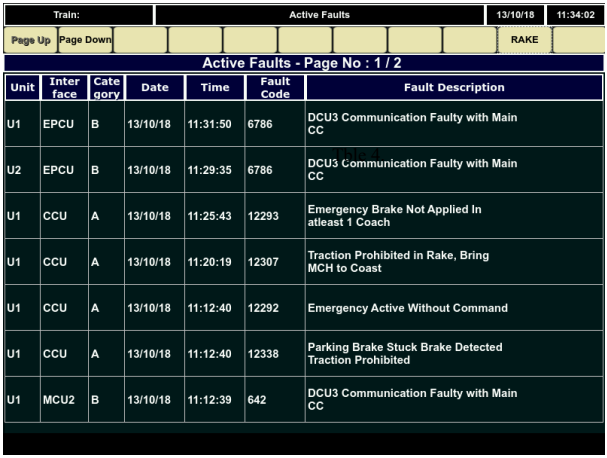

Fig. 5.11

5.1.2.9 Brake

Brake screen, shown in Fig 5.12 gives information about basic unit level and brake cylinder pressures (EP system) of train. This screen consists of two sections. First section consists all brake pressures status and second section gives options for enabling/ disabling holding brake to the train. This can be useful for the motor man while brake test validation.

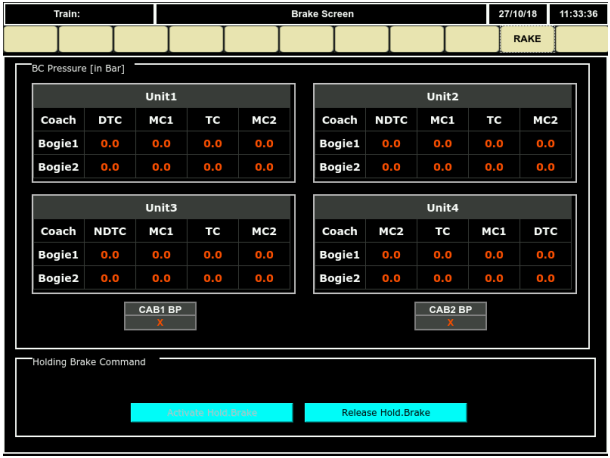

Fig. 5.12

5.1.2.10 Brightness Control

When user press ‘Brightness’ soft key, then the brightness control appears on the screen. Touch on the bar chart, controls the brightness of the screen. This brightness control disappears when user touches again the same brightness button.

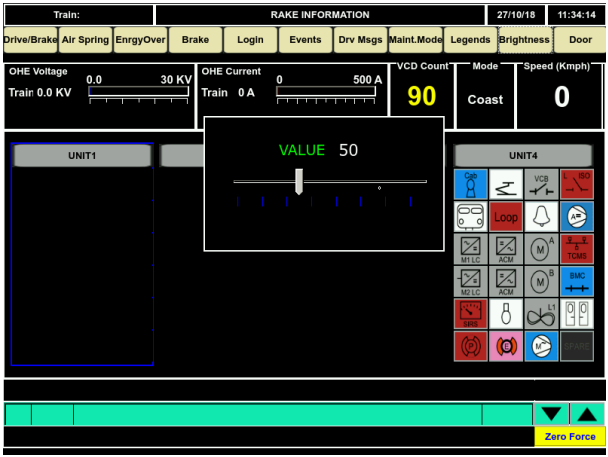

Fig. 5.13

5.1.2.11 Maintenance Mode Screen

Fig 5.14 displays different options available in the maintenance mode.

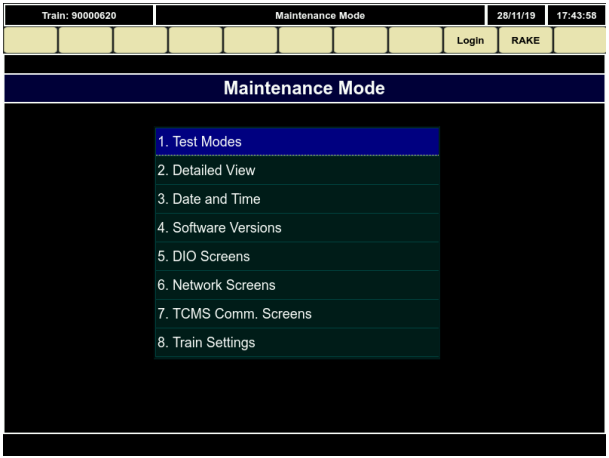

Fig. 5.14

1. Test Modes

Test Modes are defined to validate train level wiring verification, train lines checking, DTC-CAB wiring, brake related tests, etc. All test modes have few entry conditions. Before entering into any test, these entry conditions are to be satisfied.

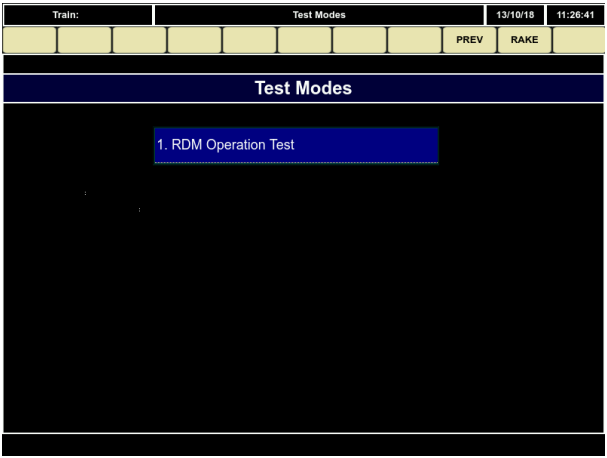

Fig. 5.15

1. RDM Operation Test

In RDM Operation test, two sub tests are available i.e.,

Frequency Input Test: Frequency Input test is defined to validate Frequency generator unit functionality. Based on selected MCH%, FGU generates the frequency to train line. All MCC, MCCR nodes which are available in basic units of the train monitors the frequency and sends back the status to CCC for validation. Finally CCC gives final results with validity information to DDU.

Train Line test: It is defined to check the present status of important train line covers Panto, VCB switches, MCH Inputs (Direction – FWD, REV, Mode

- Drive, Brake, Coast) routing to MCC and MCCR nodes which are available in all basic units of the train.

2. Detailed View

Detailed view option is defined to give information about sub system level parameter monitoring for train level functional checking. The parameters which are available in the screens can be changed or re-arranged through configuration software.

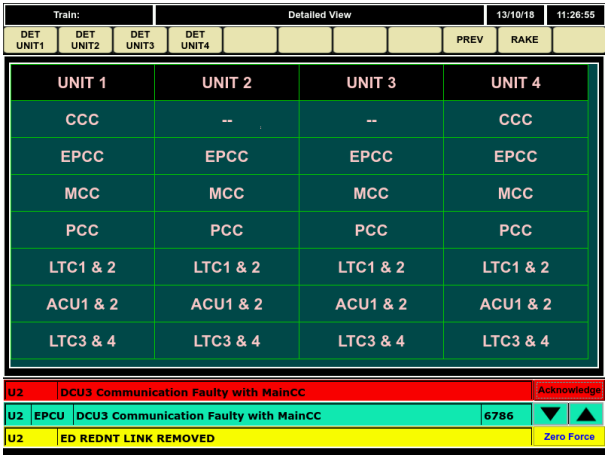

Fig. 5.16

3. Date & Time

Date and Time feature is defined to set date and time in train. User is requested to change the date & time through navigation keys and press ‘Enter’ for final configuration. All TCMS systems update the date and time locally. Following screen gives information about date & time settings.

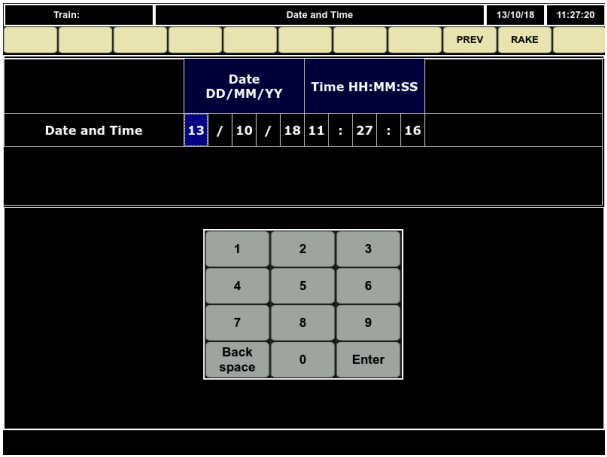

Fig. 5.17

4. Software Version

This screen used to view software version details of various modules of Train18.

5. DIO

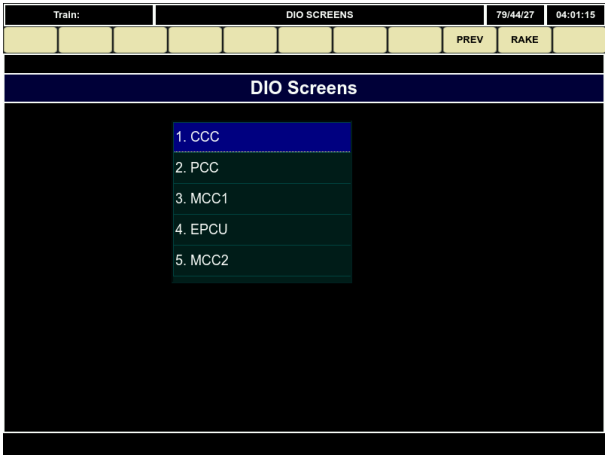

Fig. 5.18

This screen is used to view digital inputs and outputs of various control units CCC DIO screen is shown in Fig 5.19.

Fig. 5.19

6. Network screens

Network screens gives information about rake level ETB, ECN modules health information.

7. TCMS Communication Screen

TCMS screen used to view communication health information between various modules. Provision is given to view, Basic unit wise modules communication status. Module wise communication health status shown in Fig 5.20.

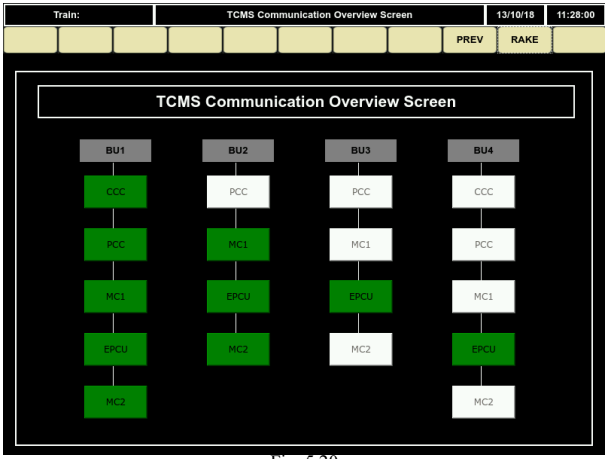

Fig. 5.20

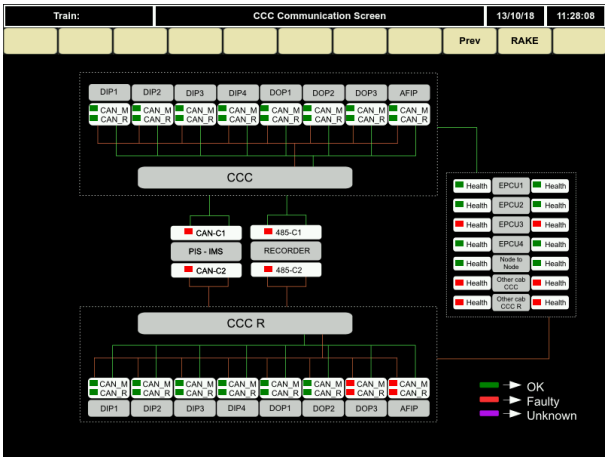

Fig. 5.21

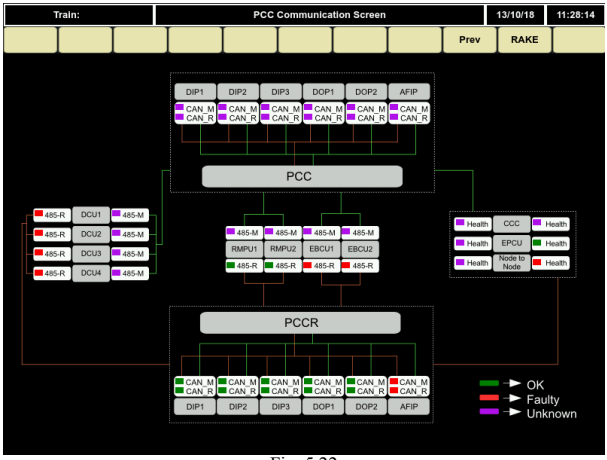

Fig. 5.22

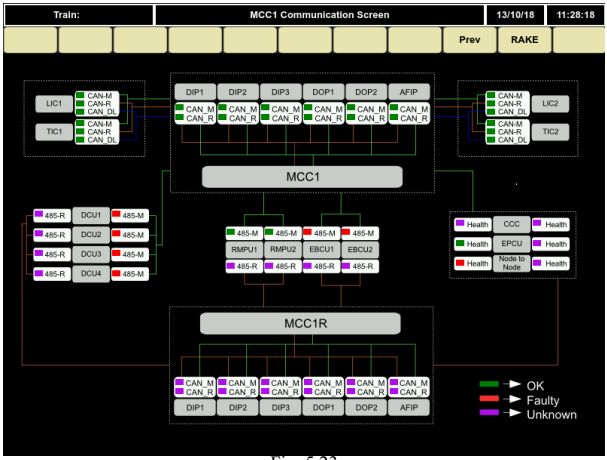

Fig. 5.23

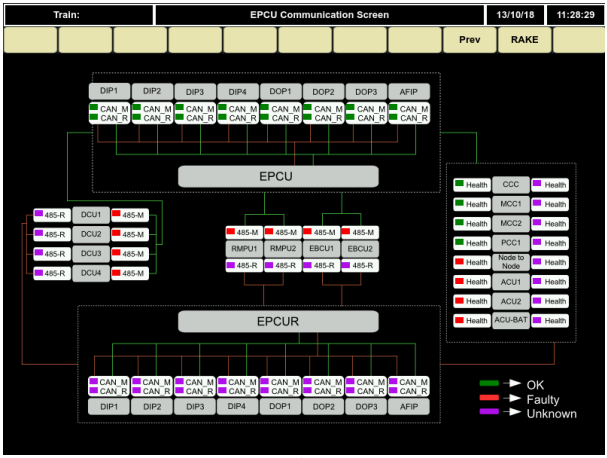

Fig. 5.24

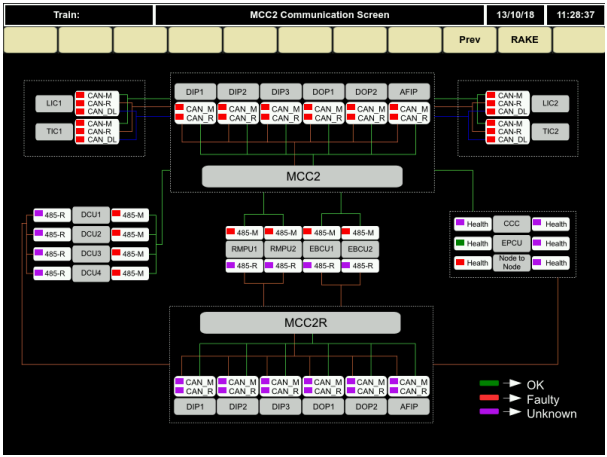

Fig. 5.25

8. Idle Stop

This option to be used to allow the pendrive safe removal function

9. Train Settings

Train settings are defined to forcibly change the normal functionality of EMU operation. Some of these settings can be done by Maintenance person (Main.ID is required). All settings can be done when predefined entry conditions are satisfied. Some of the settings are not allowed in train running case. All these entry conditions are displayed when navigating through selected settings in the train settings menu. TCMS stores the changed settings information and displays suitable message in DDU. All

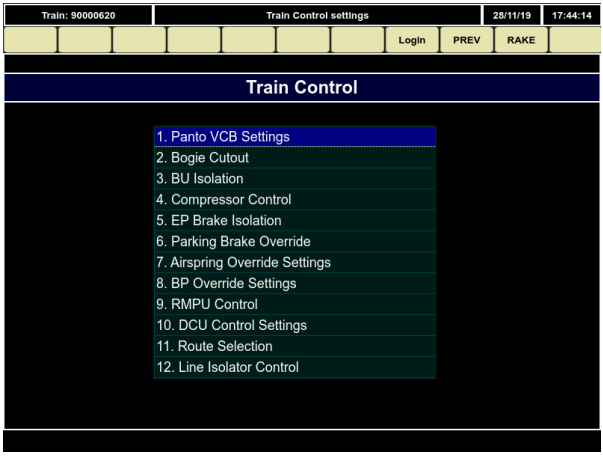

Fig. 5.26

these changed setting information are stored in TCMS until power Reset.

1. Panto and VCB Settings

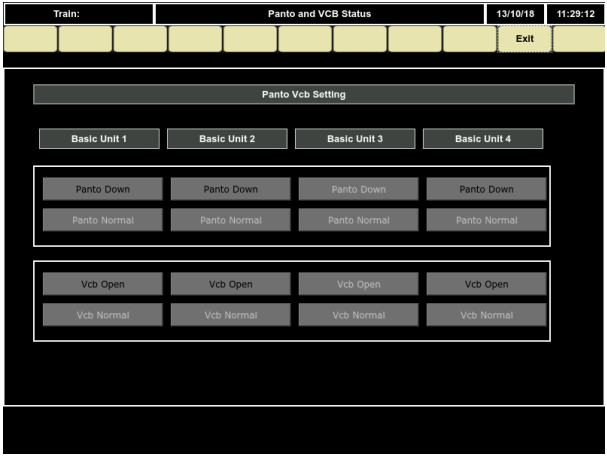

Fig. 5.27

Panto and VCB setting are used to open VCB and to down the pantograph of any particular basic unit in the rake formation. But VCB close operation and raising of pantograph operation are not possible.

2. Bogie Cutout

Bogie cutout setting is used to isolate the bogie1/ bogie 2/ both bogies of selected basic unit in the rake formation. For isolated bogies, traction, electrical braking are not available.

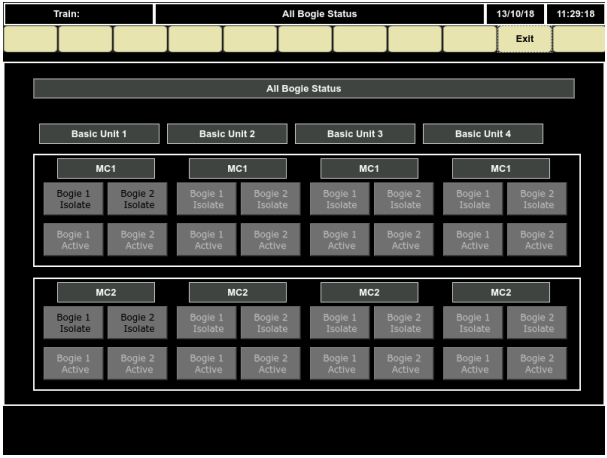

Fig. 5.28

3. BU Isolation

BU Isolation setting is used to isolate the basic unit from the rake formation. For isolated basic unit, power is not available for traction and braking operation, since pantograph is made down by system. For this unit, aux supply is available through change over contactors from adjacent basic units (if power available). This feature is as good as basic unit isolation switches functionality which are available on ECC panel of DTC Cab.

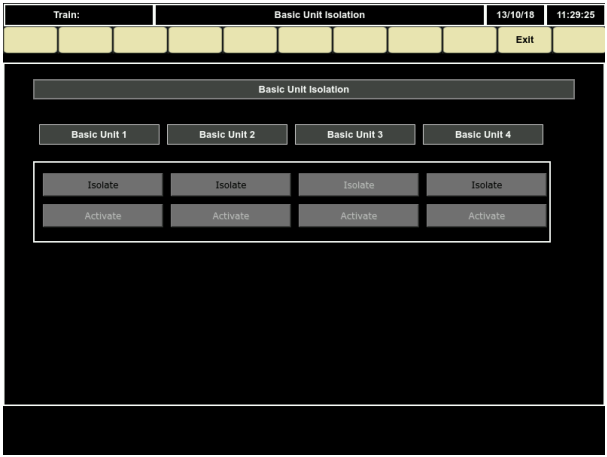

Fig. 5.29

4. Compressor Control

Compressor Control setting is used to control the compressor from DDU. In this setting, we can switch ON or switch OFF compressor of any of basic unit. Once compressor ON command is received from this setting, then the corresponding compressor shall be ON until pressure is reached to healthy range.

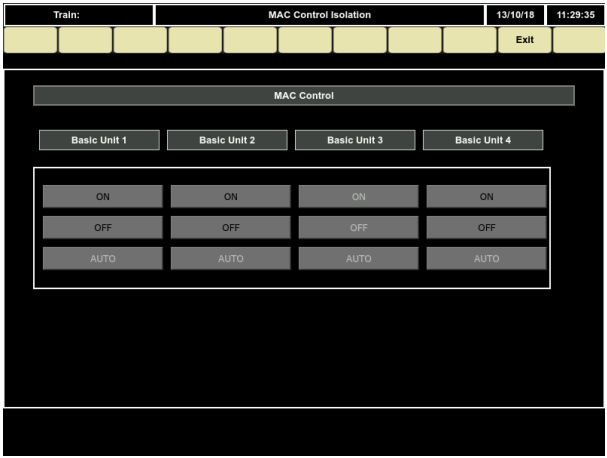

Fig. 5.30

5. EP Brake Isolation

EP Brake Isolation setting is used to isolate the EP unit (bogie/ coach level) functionality of any basic unit in the rake formation. Once EP unit is isolated coach wise, then MCC/ MCCR prohibits EP brake to that coach and considers coach EP brake availability as Zero.

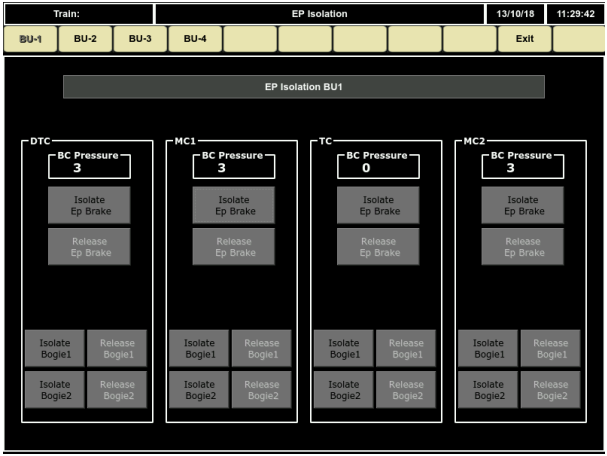

Fig. 5.31

6. Parking Brake Override

Parking Brake Override setting is used to override the parking brake status in the selected basic unit. Once override is selected, then TCMS ignores parking brake status of that basic unit for parking brake lamp driving, stuck brake condition checking, Vmax limitation due to parking brake stuck, etc.

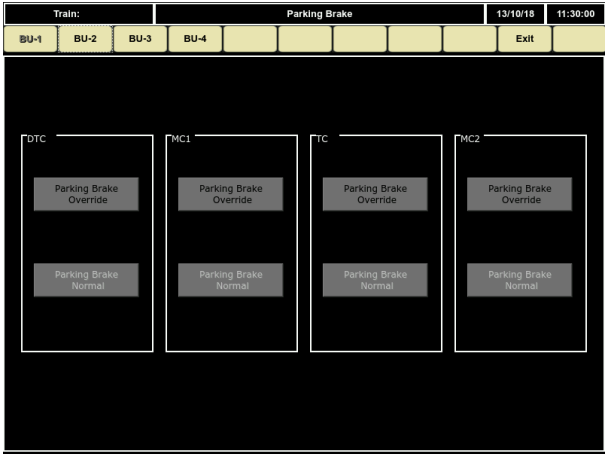

Fig. 5.32

7. Air spring Override Settings

Air spring override setting is used to override the air spring status in the selected coach in a basic unit. Once override is selected, then TCMS ignores air spring failure status of selected coach, so that speed restriction due to suspension failure feature gets bypassed.

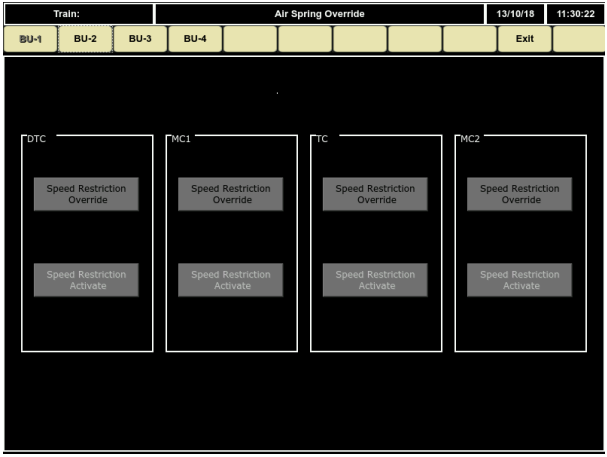

Fig. 5.33

8. BP override settings

BP override setting is used to override the BPstatus in the selected coach in a basic unit. Once override is selected, then TCMS ignores corresponding BP status of selected coach, so that speed restriction due to BP failure feature gets bypassed.

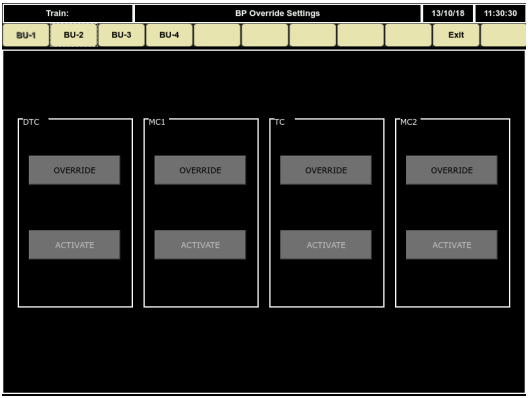

Fig 5.34

9. RMPU Control Screen

RMPU control screen can be used to give forced RMPU command either 50% or 100% or OFF command in any coach for any RMPU.

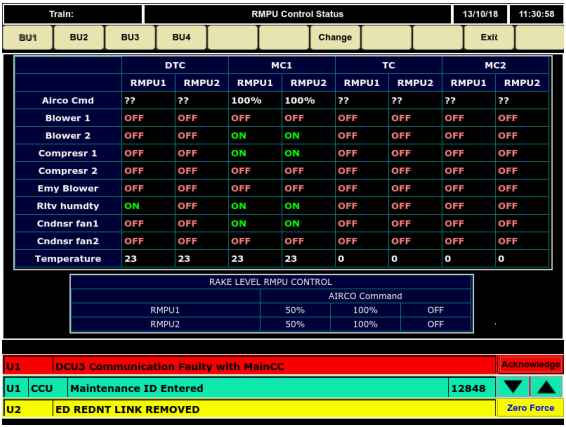

Fig 5.35

10. Door Control Settings

Door control settings screen can be used to provide door open/ close command to any door in any coach.

In case of failure of All door proving loop, provision is given to override the ADCR relay, so that Door Proving Loop can be ignored for traction.

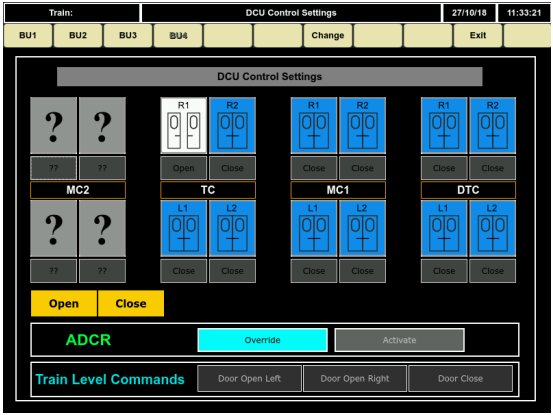

Fig 5.36

11. PIS Route Selection

There is a provision to select the train route through TCMS display. This feature can be useful to enable destination information only on head code, in case of PIS MMI is non functional and unable to select the train route.

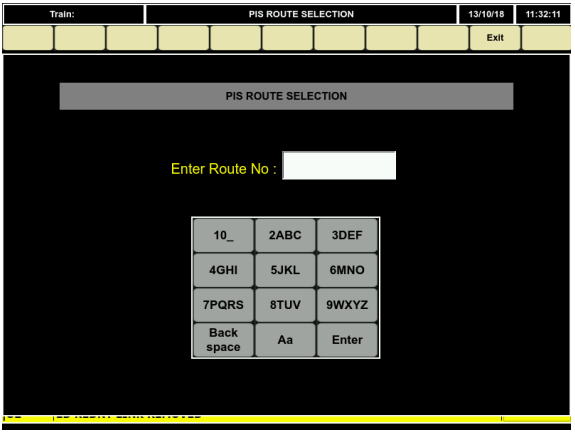

Fig 5.37

12. Display Legends Information

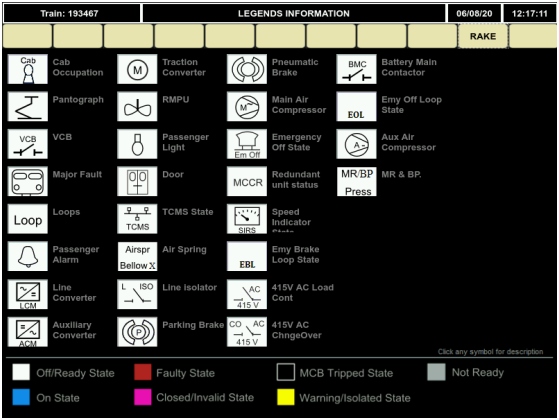

Fig 5.38

Chapter 6

CAB REAR WALL PANEL & ECC PANELS

DTC coach contains two rear wall panels, CRW and GCRW. MC, TC, and NDTC contains one ECC panel in each coach.

6.1 DTC CRW

6.1.1 Isometric View of DTC CRW

One electrical cubicle is provided at rear side of driver driver cab. It houses all electrical and electronics components required for rake level control. It houses CCU'S, LRMS, TPWS, ECN Switches, MCB's, Relays & contactors for various application. Equipment layouts are shown in below section

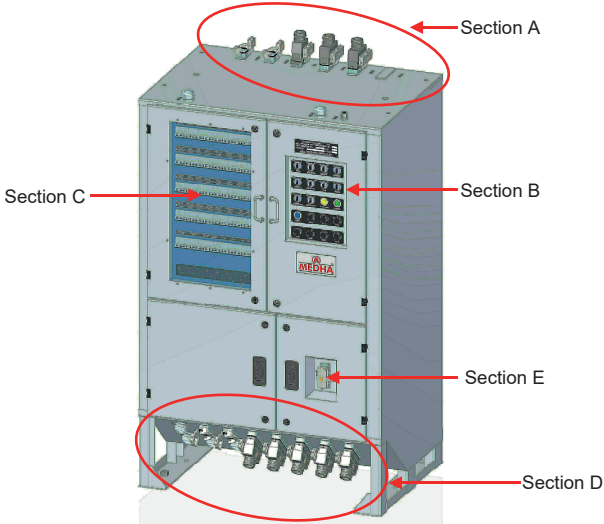

Fig 6.1 Isometric View of DTC_CRW

6.5 NDTC ECC

One Electrical Cubical is provided at driving end of NDTC cab. It houses all electrical & electronics components required for rake level control. It houses PCUS, EBCUS, MCB, Relays, and contactor for various application. Equipment layouts are shown in below section.

6.5.1 Isometric View of NDTC ECC

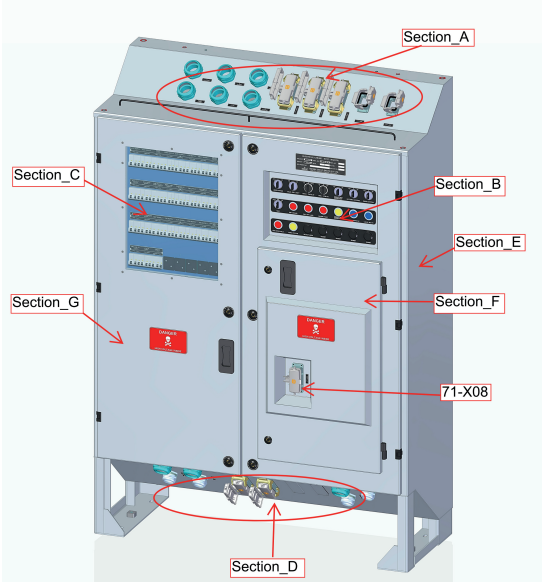

Fig 6.11 Isometric view of NDTC_ECC

7.7 MC_P2-Panel Description

One End Wall panel (P2) is located at the Left side of non driving end or toilet end on MC/ TC/ NDTC coach. P2 panel consists of MC1/TC/NDTC houses Terminal blocks, MCBs, Reading Lights Mono Block pump(User Railway scope). MC2 houses all the material same as MC1 and additionally 415V changeover contactors are placed. Equipment layouts are shown in below section.

Chapter 8

SHUNTING PANEL

Shunting panel is a small panel used to drive the train during master controller failure in DT cab. This panel consist of few important switches which are required to move the train. This shunting panel is located in DTC driving cab inside DTC CRW panel. This panel has an open cable end with assembled connector to get interfaced with DTC CRW panel. It can be used to drive the rake, in case if master controller fails.

This shunting panel can also be integrated with NDTC ECC panel to move individual basic unit.

Main components of the shunting panel are:

- Direction selection switch
- Cab occupation switch
- Drive Push button
- Brake push button
- Emergency OFF push button.

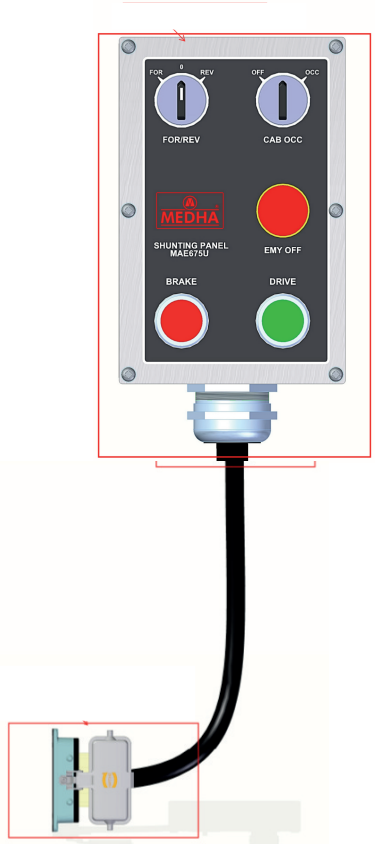

Fig 8.1 Detailed view of Shunting Panel

Chapter 9

AUXILIARY CONVERTER

9.1 Introduction

There are two auxiliary converters available in each basic unit, mounted under slung in TC coach. These auxiliary coveters generate 415 V AC and 110 V DC to provide supply to various loads. A 20 kVA isolation transformer is provided in each coach to convert 415 V AC supply to 230 V AC and 110 V AC. 230 V AC supply is used for pantry related loads and toilet related loads like shaver and hand drier. 110 V AC supply is used for laptop and mobile charging for passengers.

9.2 Auxiliary technical details

9.2.1 AC1 Electrical Data

Requirements	Parameters
Input Voltage	Single phase 285 Vac to 450 Vac input from Auxiliary secondary winding of main transformer
Control Supply	77 V to 137.5 V DC from battery (110 Vdc nominal)
Output capacity	Output: 275 kVA, 415 V±5% (L-L), 50 Hz±3%, 3 Phase, Sine wave (at >19 kVac OHE) At <19 kVac OHE, output voltage shall drop by maintaining V/F ratio constant.
Short time rating	For 415 Vac output: 150% of rated current for 5 Seconds without increasing active power.
Efficiency	> 92%
Noise Level	< 80dB(A)
Voltage - THD	<=5%

Table 9.1

9.2.2 AC2 & DC Converter Electrical Data

Requirements	Parameters
Input Voltage	Single phase 285 Vac to 450 Vac input from auxiliary secondary winding of main transformer
Control Supply	77 V to 137.5 Vdc from battery (110 Vdc nominal)
Output capacity	**Output-1:** 235 kVA, 415 V±5% (L-L), 50 Hz±3%, 3 Phase, Sine wave (at >19 kVac OHE) At <19 k Vac OHE, output voltage shall drop by maintaining V/F ratio constant. **Output-2:** 110 to 125 V DC (It is varying as per DC load sharing current requirement) DC Power: 30 kW at 110 V DC (BN, BD and Battery charger loading on this).
Short time rating	For 415 Vac output: 150% of rated current for 5 seconds without increasing active power. For 110 Vdc output: Current limit topology is used. So there will not be any short time rating.
Efficiency	> 92%
Noise Level	< 80dB(A)
Voltage-THD	<=5%

Table 9.2

9.2.3 Auxiliary Converter Cubicle Climatic and Environmental Data

Requirements	Parameters
Operating Temperature	Outside ambient temperature: 0-50ºC
Cooling	Forced cooling by build in blower
Type of mounting	Under-slung
Ingress Protection	IP-65 upto 400 mm height from track level. Above 400 mm, it is IP-20. Magnetics and terminals are in IP-20 protection zone.
Humidity	98%.

Table 9.3

9.2.4 Battery Charging System Electrical Data

Requirements	Parameters
Input Voltage	115 V to 125 Vdc (From BN Bus i.e. from DC output of ACU)
Control Supply	77 V to 137.5 V DC from battery (110 Vdc nominal)
Output capacity	77 V to 115 Vdc (It varies as per battery charging current requirement) Charging current: 33 A (charging current limit is provided at 30 A)
Short time rating	Current limit topology is used. So there will not be any short time rating.
Efficiency	>95%
Noise Level	< 80dB(A)

Table 9.4

9.2.5 Battery Charging System Climatic & Environmental Data

Requirements	Parameters
Operating Temperature	Outside ambient temperature: 0-50ºC
Cooling	Natural cooling
Type of mounting	Under-slung
Ingress Protection	IP-65
Humidity	98%.

Table 9.5

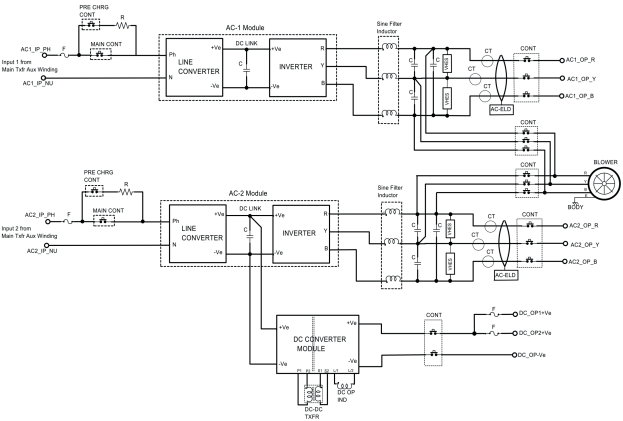
9.3 Functional Description

Auxiliary power supply consists of two physical cubicles in each basic unit.

1. **Auxiliary Converter Unit (ACU):** ACU is mounted under frame of TC coach. Each ACU consists of two 415 Vac 3-phase inverter modules (AC1 and AC2) and one 110 V DC converter module.
2. **Battery Charging System (BCS):** BCS is mounted under frame of DTC/ NDTC coach. The function of BCS unit is to charge the battery.

9.3.1 Auxiliary Converter Unit (ACU)

ACU consists of below functional sections.



9.3.1.1 Input section

Input of the auxiliary inverter is taken from the auxiliary secondary windings of main transformer. Input section consists of input fuse and input isolation contactor. The purpose of input fuse is to protect converter from over current. Input isolation contactor is used to isolate the converter from input, in case of any failure occurred inside the converter. One pre-charging circuit is used to charge DC link capacitors during initial start up condition.

9.3.1.2 Line converter

Line converter converts variable single phase AC input to fixed DC-link by controlling pulses of IGBTs using DSP controller. Line converter maintains unity power factor at AC input. There are two line converters provided in each aux inverter unit. Output of two line converters is connected in parallel to share the total DC link power. Inverter and DC-DC converter modules are connected to the common DC link.

Power scheme of one line converter is shown below.

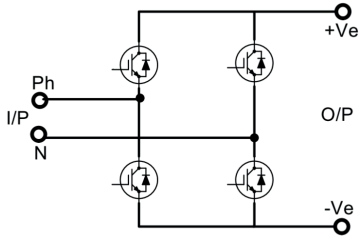


Fig 9.1

9.3.1.3 3-Phase Inverter

3-Phase inverter converts DC-link voltage to 415 Vac, 3-phase output by controlling pulses of IGBTs using DSP controller. Inverter output maintains V/F constant. Inverter module has pulse to pulse short circuit protection.

Power scheme of inverter is shown below.

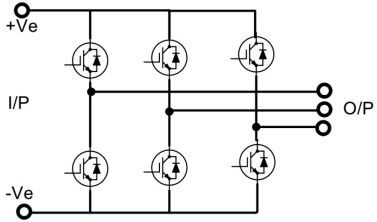

Fig 9.2

9.3.1.4 3-Phase Sine filter

3-Phase sine filter is provided at output of 3-phase inverter to get a pure sine wave output. Inductors and capacitors are used to build sine filter.

9.3.1.5 DC Converter

DC converter takes supply form DC-link of AC2 and converts DC-link voltage to isolated and regulated 110 Vdc output by controlling pulses of IGBTs using DSP controller. DC converter consists of H-bridge converter, isolation transformer, rectifier and filter. DC converter also regulates output voltage to maintain current share at output.

Power scheme of DC converter is shown in Fig 9.3.

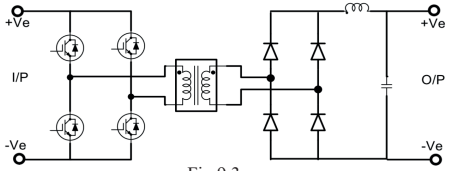

Fig 9.3

9.3.1.6 Output Section

Contactors are provided in 415 Vac and 110 V DC output to isolate ACU from loads, in case of failure. Voltage, current, and ELD sensors are provided to monitor and control ACU parameters and to protect it.

9.3.1.7 Controller Module

Controller module controls the line converter and inverter. It is also responsible for monitoring and protecting the complete auxiliary inverter and record the faults in the memory. It also interfaces with TCMS to get commands and send status to display at driver cabin.

9.3.1.8 Cooling system

Forced air cooling is provided for auxiliary converter unit, by using blower inside the auxiliary converter enclosure. This blower is used for cooling all IGBT based modules and magnetics. It sucks air from the air inlet and forces through all IGBT module heat sinks and all magnetics and then leaves out to air outlet. This blower takes 3-phase 415 V AC supply from inverter (AC1 or AC2) internal supply.

9.3.2 Battery Charging System (BCS)

Battery charging system is a PWM based IGBT converter, which gets supply from BN bus and charge the battery with constant voltage and constant current limit topology.

There is a reverse flow diode in battery charger, which conducts at the time of battery back-up. BCS has one contactor, called BN contactor which isolates BN bus from BD bus.

There is a controller module, which is responsible for monitoring and protecting the complete battery charger and record the faults in the memory. It also interfaces with TCMS to get commands and to send status to display at driver cabin.

Battery charger unit is made with natural cooled design.

Power scheme of battery charger module is shown in Fig 9.4.

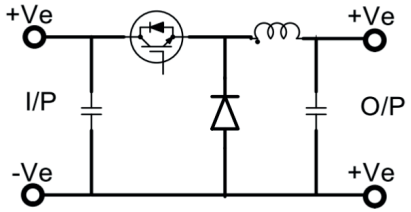

Fig 9.4

Chapter 10

BRAKE SYSTEM DESIGN

Following are the different types of brake systems present in Train18:

1. Regenerative brake or electro dynamic brake
2. Pneumatic brake or auto brake
3. Electro-pneumatic brake
4. Parking brake

10.1 Auto Brake

Auto brake is a pneumatic brake and is controlled by Auto brake handle provided in DTC. Whenever auto brake handle is moved, BP pressure drops and equivalent difference in pressure is developed in brake cylinder by triple valve of EP unit. Hence braking effort, equivalent to brake cylinder pressure gets developed.

10.2 Service Brake

Service brake is a combination of ED (Electro Dynamic/ Regeneration) and EP (Electro Pneumatic) braking. Based on MCH brake command requested by motor man, CCU

calculates total required Braking Effort (BE) and this is distributed among various basic units for final brake application. Based on the braking effort received at MCU, MCU further performs brake blending among ED brake and EP brake for final brake application.

Following are the components or control systems used for incorporation and actuation of service brake:

10.2.1 Master controller

Master controller is an interface to motor man for issuing morting request, braking demand, forward & reverse directions, dead man handle & emergency brake. Generally, occupied cab master controller will be active to issue command.

10.2.2 TPWS Interface

At present, there is no TPWS interface in Train -18. But provision is given to incorporate this feature in future. Two TPWS brake application related digital inputs are interfaced with CCU to know the brake status/ request of TPWS. One digital input gives information about service brake request and the second digital input gives information about emergency brake applied information. In case of service brake request given by TPWS through digital input, CCU considers it as full service brake request.

10.2.3 CCU1 and CCU2

CCU1 and CCU2 is redundant control system located in DTC and interfaced with Master controller for reading

brake commands. It also calculates the brake force based on the train weight (load sensors), availability of different EP units and regenerative brake force available. Then it redistributes all the brake force among different basic units for brake application through ETB.

10.2.4 MCU and MCUR

MCU receives total brake force to be applied from CCU through ETB. After that MCU calculates the available regenerative brake force and remaining are considered as EP brake. So always priority is given to ED brake while applying the service brake. Remaining brake effort is applied as EP brake in trailer coaches first, then in MC coach. Normally MCU will act as EP brake master and communicates with both EBCUs of that coach. In case of failure of MCU as EP brake master, MCUR will take over as EP brake master and communicates with EBCUs for EP brake application.

EP brake force = Total brake force - Available regenerative brake force

10.2.5 Application and holding valve

Application and holding valves are solenoid valves which are available in EP brake unit. Application valve is energized to open solenoid valve. It is used to charge the air into brake cylinder for application of EP brake. Similarly holding solenoid valve is energized to close valve. It is used to discharge the air from brake cylinder for release of EP brake.

Chapter 11

HIGH VOLTAGE SYSTEM OVERVIEW

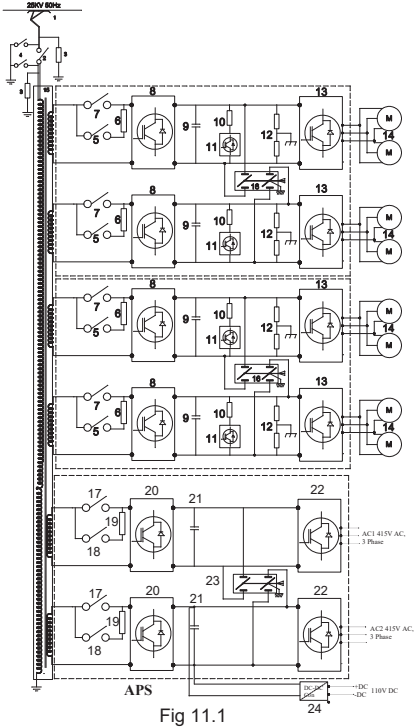

Fig 11.1

16	DC Link Earthing Switch
17	Main Contactor
18	Pre charging Contactor
19	Pre charging Resistor
20	Line Contactor
21	DC Link Capacitor
22	3 Phase Inverter
23	Earthing Switch
24	DC-DC Converter

Fig. 11.1 shows the power schematic of Train 18 with emphasis on the traction converters. 25 kV OHE voltage is connected to the transformer primary winding through the Vacuum Circuit Breaker (VCB). When transformer primary windings are not connected to OHE lines, an

earthing switch (connected in parallel to VCB) is used to ground the transformer primary winding and pantograph.

Transformer secondary has 4 traction windings rated at 603 kV A each and 2 auxiliary windings rated at 234 kVA each. Transformer is oil cooled with help of oil pump and blowers which cool the radiator through which oil is circulated using the oil pump.

There are two forced air cooled line and traction converter cubicles per each MC. Each line and traction converter cubicle consists of one line converter, DC link and one traction inverter. The line converter interfaces with transformer secondary traction winding on one side and DC link on the other side. The line converter consists of single-phase full bridge rectifier with IGBTs as active switching devices. The DC link consists of earth leakage detection circuit, DC link capacitor bank, and brake chopper circuit (for over voltage protection). The traction inverter consists of a 3-phase full bridge inverter with IGBTs as active switching devices. The line and traction converter come with its own Line and Traction computer, which control and protect the converter. Line and Traction Control Unit (LTCU) controls both the line converter and traction inverter and then communicates with the Main Control Unit (MCU) through CAN interface.

Two auxiliary converters are provided in TC coach. One auxiliary converter generates 3 phase 415 V AC supply and other Auxiliary converter generates 3 phase 415 V AC supply and DC 110 V supply.

There is a pantry transformer provided in each coach, which takes 415 V AC as input supply and converts to 230 V AC and 110 V AC. Mainly 230 V AC supply is used for pantry and hand drier, shaver in toilet. Mainly 110 V AC supply is used for laptop charging and mobile charging. Mainly 110 V DC supply is used as control supply for all the control units, relays, contactors, lamps etc.

Chapter 12

PANTOGRAPH CONTROL

12.1 Purpose

The main purpose of pantograph is to collect the supply from overhead OHE for train propulsion system and to send back energy to the OHE during regeneration braking.

The pantograph is mounted on the roof of TC coach.

One auxiliary compressor is mounted under frame in TC coach to build pressure in panto reservoir for pantograph electro pneumatic control initially. During normal run, main compressor is used to maintain the pressure for panto operation.

12.2 Train level panto control

In case of normal mode, CCC shall derive panto up/ down commands and send to all the basic units and MCC units for final action.

In case of panto momentary switch is operated toward ‘up’ in the occupied cab, CCC drives panto up command by checking the ‘Panto up’ digital input signal pulse status and sends to all MCC units through ETB communication for final action. Likewise, CCU detects all momentary inputs based on a pulse read for a specific time.

Similarly in case, panto momentary switch is operated toward ‘down’ in the occupied cab, CCC drives panto down command by checking the ‘down’ digital input signal pulse status and sends to all MCC units through ETB communication for final action.

At the same time, corresponding train lines are generated from occupied cab. MCC also determines up, down commands through train lines. MCC ignores these commands in case of normal mode. Train line commands are accepted only during RDM mode.

Fig 12.1 logical diagram shows train level panto command derivation.

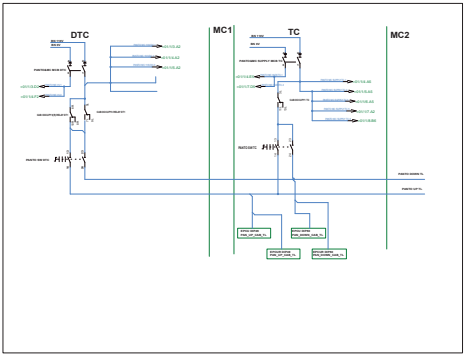

Fig 12.1

12.2.1 Basic unit level panto control

Based on panto related commands received from ETB (in case of normal mode) or panto related commands derived from train lines (in case of RDM mode), EPCC drives panto up digital output by considering following conditions.

- Panto selector switch mode
- No EOL loop condition triggered
- No Panto low pressure switch is detected
- Panto up command detected
- No basic unit isolation is selected and
- No VCB contactor stuck at high-level condition occurred.

EPCC drives the panto down digital output based on panto down command detected or if any above conditions are not satisfied.

In case VCB trip condition occurs in the basic unit, EPCC downs the pantograph when VCB contactor stuck at high condition is detected (unable to open VCB condition).

The following logical diagram gives information about basic unit level panto control.

12.2.2 Pantograph status Indication Lamps

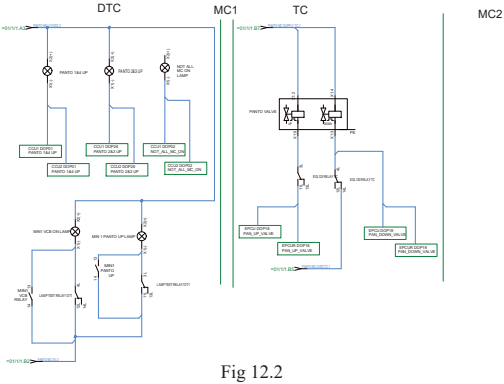

Fig 12.2

In driver desk, one lamp is available related to pantograph status name it as ‘min 1 panto up’. This lamp is driven through state of panto hard-wired train line.

This state of panto hardwired train line is driven by any of EPCC unit in TC coach based on panto up status and OHE voltage available information.

In DDU rake screen and individual basic units screens, panto symbol is available. DDU gets each basic unit Panto status from EPCC, based on panto status will be displayed on DDU.

12.2.3 Auto Drop Down (ADD) feature

ADD feature, available in pantograph design is used to lower the pantograph automatically in case of any break

or damages of the collector strip. This feature helps to avoid further damage of pantograph as well as catenary.

- ADD feature status can be detected by EPCU through ADD pressure switch.
- In case of pantograph healthy condition, which means no ADD detected, pressure switch status becomes ON (pressure is greater than 3.0 bar).
- In case pantograph lowers by ADD feature, the pressure switch status becomes OFF (pressure is less than 2.7 bar).
- With the detection of pressure switch status as OFF by EPCU, EPCU opens VCB immediately and generate fault message and send the same information to CCU.
- EPCU disables pantograph UP control operationG.

12.2.4 Over Reach Detection (ORD) feature

- ORD feature, available in pantograph design is used to lower the pantograph automatically in case pantograph raises beyond the set height limit.
- This ORD feature status can be detected by EPCU through ORD pressure switch.
- In case pantograph healthy operation, which means no ORD detected, pressure switch status becomes ON (pressure is about 0 bar).

- In case, pantograph lowers by ORD feature, the pressure switch status become OFF (pressure is greater than 1 bar).
- On detection of pressure switch status OFF by EPCU, EPCU opens VCB immediately and generate fault message and sends the same information to CCU.
- EPCU disables pantograph UP control operation until fault can be reset by maintenance person.

12.2.5 Panto mode

- On driver desk Panto mode selector switch is provided with 2 selection positions to select Panto 1-4 mode or Panto 2-3 mode.
- In corresponding position one train line will be generated, which can be used during RDM mode.
- Based on the selection, corresponding Pantos will made UP.
- In case of one panto failure of corresponding mode, corresponding panto UP lamp indication (Either Panto 1-4 UP or Panto 2-3 UP lamp) will start blinking.
- Based on this driver need to move the switch to other position to select the other 2 pantos.

Chapter 13

VCB CONTROL

13.1 Purpose

VCB is used as a line circuit breaker to close and open the power circuit and also to break the circuit under overload and short circuit conditions. It provides connection between catenary and propulsion equipment. It is placed in roof of TC coach.

It is an electro pneumatic control. EPCC drives one digital output to energize VCB on relay, only if pantograph has already raised, providing supply to electro pneumatic valve for VCB close operation.

13.2 Train Level VCB Control

In case of normal mode, CCC derives VCB close or open commands and send to all basic unit EPCC units for final action.

In case VCB momentary switch is operated toward ‘ON’ position in the occupied cab, CCC derives VCB close command by checking the ‘ON’ digital input signal pulse status and sends to all EPCC units through ETB communication for final action.

Similarly In case VCB momentary switch is operated toward ‘OFF’ position in the occupied cab, CCC derives VCB open command by check the ‘OFF’ digital input signal pulse status and sends to all EPCC units through ETB communication for final action.

At the same time corresponding train lines are generated from occupied cab. EPCC also determines VCB close, open commands through train lines. But EPCC ignores these commands in case of normal mode, but considers only in RDM mode.

The following logical diagram shows train level VCB command derivation.

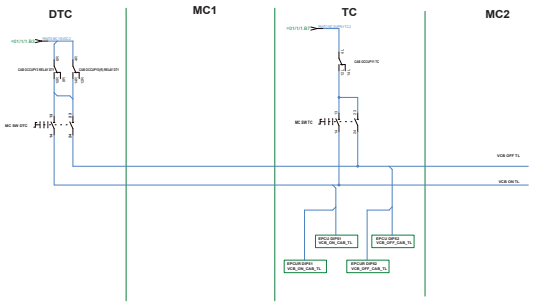

Fig 13.1

13.2.1 Basic unit level VCB control

Based on VCB related commands received from ETB (in case of normal mode) or panto related commands derived from train lines (in case of RDM mode), EPCC drives VCB ON digital output by considering following conditions.

- No EOL loop condition triggered
- No Panto low pressure switch is detected
- Panto up command detected
- No basic unit isolation is selected and
- No VCB contactor stuck at high-level condition occurred.

EPCC opens VCB based on the VCB open command detected or any of the above condition are satisfied

In case VCB trip condition occurs in the basic unit, EPCC opens VCB.

The following logical diagram gives information about basic unit level VCB control.

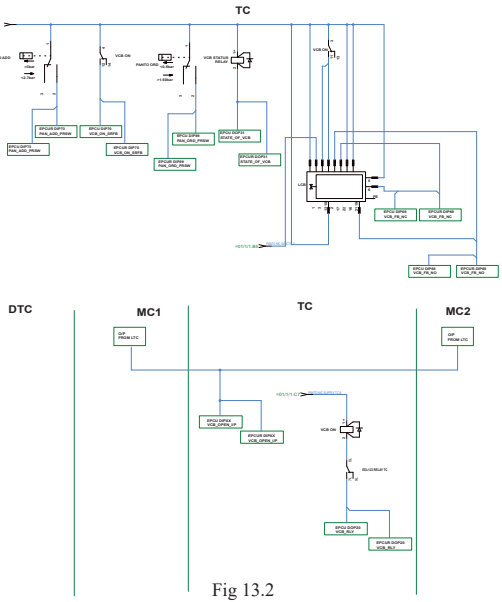

Fig 13.2

13.2.1.1 VCB Status Indication Lamps

In driver desk one lamp is available related to VCB on status name it as ‘min 1 VCB close’. This lamp is driven through state of VCB hard-wired train line.

This state of VCB hardwired train line is driven by any of EPCC unit in MC coach based on VCB on feedback status.

In DDU rake screen, individual basic units screens, VCB symbol is available. DDU gets each basic unit VCB status

from EPCC, based on this VCB status will be displayed on DDU.

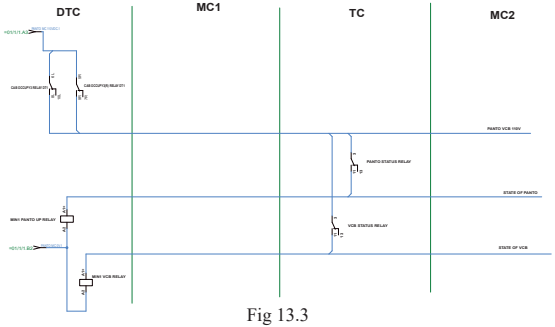

Fig 13.3

EPCC will know the status of VCB by read redundant feedback auxiliary NO, NC contacts.

13.2.2 Drive Brake Control

Drive Brake Control of the train is controlled by CCU present in DTC based on the inputs received from Driver's Desk. CCU will accept the drive brake controls only in case the cab is occupied by inserting a key switch.

13.2.3 SHUNTING PANEL

Shunting panel is a small used to drive the train during Master controller failure in DT Cab. This panel consist of few important switches used to drive the train. This shunting panel is located in DTC driving cab inside DTC CRW panel. This panel has a open cable end with assembled connector to get interfaced with DTC CRW

panel. It can be used to drive the rake, in case of master controller is failed.

This Shunting Panel can also get integrated with NDTC ECC panel to move Individual Basic Unit.

Main components of the shunting panel are given below

- Direction selection switch
- Cab occupation switch
- Drive Push button
- Brake push button
- Emergency OFF push button

Chapter 14

TCMS

Train Control and Management System (TCMS) consists of following subsystem:

- Two redundant CCUs in DTC for train level control.
- MCUs in MC coach for basic unit level control.
- PCU for passenger related load control, main air compressor control and parking brake control.
- EPCU for transformer related blowers and oil pump control.
- Frequency generator for distributing TE/ BE % through train line. In case of special RDM mode, this will be used by MCU/ MCUR for TE/ BE calculation.
- Redundant ETB and ECN communication.

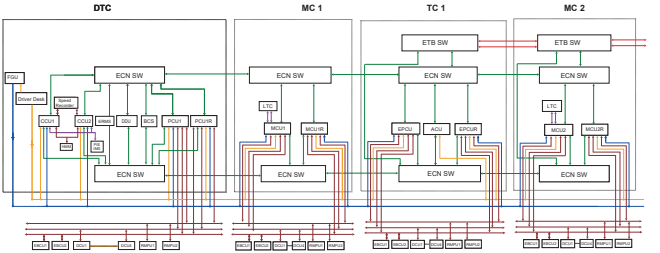

Fig. 14.1. Interconnection of Different Control Units in End Basic Unit

Fig 14.1 shows interconnection of different control units of Train Control and Management System (TCMS). CCU1 and CCU2 acts as interface to loco pilot and receives all the driver inputs, analyzes it and transmits control data to EPCUs using ETB network, used for motor control. EPCU analyzes this received control data and finally updates the control data to different units connected to it i.e.,

- Passenger comfort related commands to PCU1, PCU2 of DTC and MC coach.
- Auxiliary control unit is also communicated using ECN communication
- Traction and brake commands to MCC of MC coaches.

All these interfaces communicate with EPCU to update their status for data recording purpose by DMC and for performing closed loop control action by EPCU using the same medium in response to the control data received from EPCU. Finally, this status data is routed to CCU from EPCU using ETB. CCU uses this status data for fine

control of traction and braking parameters of the train and also sends the same data to EPCU for recording data in local flash, ERMS is located in DTC1 coach. It gets the data from all basic units EPCUs and, transmits to remote server to view the status of rake on Medha provided website through internet and to update the status to the human machine interface.

Fig 14.2 shows the inter connectivity of different control units in the middle basic unit. These units perform the same function of end basic unit.

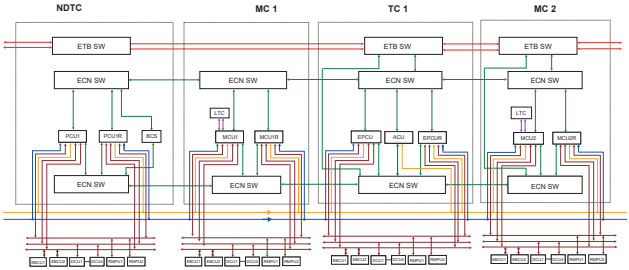

Fig 14.2 Interconnection of Different Control Units in Middle Basic Unit

14.1 Sub System Overview

Following are subsystems of TCMS

14.1.1 Central Control Unit (CCU)

CCU is a dual redundant system located in DTC and is part of integrated control system provided for Train 18. CCU is used as complete control master for entire EMU formation. All the control related calculations are done by CCU & it is distributed to different control systems in other coaches through dual redundant ETB communication for final action. There are two CCUs in each driving trailer coach working in active-standby mode for central control and monitoring. So in one rake formation, there will four CCUs present, out of which one CCU in occupied DTC will be working as Master, other CCU in occupied DTC as active-standby and remaining two CCUs in non-occupied DTC will be working as slave.

14.1.2 Driver Display Unit (DDU or HMI)

Driver Display Unit (DDU) is based on TFT LCD and is a human machine interface through which user interacts with the system. There are two displays in the train, one in each end driver cab of DTC (Cab1, Cab2). Display module gets the data from all the basic units EPCUs through redundant ECN communication. It provides user with the necessary data of what exactly is going within the system and it has a user friendly menu driven operation. Driver display unit serves the following functions:

- Viewing of entire train operational status
- Viewing of individual basic unit operational status
- Fault announcements, wherever driver information/ intervention is required
- Viewing of active faults information
- Viewing of fault/ event history
- Viewing of train energy consumed and regenerated information
- Self test modes
- Software versions of the sub modules of the system
- Individual bogie isolation feature
- Individual pantograph and VCB opening feature
- Train configuration information etc

14.1.3 Frequency Generator Unit (FGU)

Frequency Generator Unit (FGU) is located in DTC and it generates a frequency signal (TE/ BE%) corresponding to drive/ brake command given by motor man. This frequency signal is run as HWTL signal for CCU, MCU, and MCUR of all basic units. In case of ETB failure, this frequency signal is used to derive %TE or %BE demand.

14.1.4 Main control Unit (MCU)

Two MCUs are provided in each MC coach. Normally MCU1 is master. In case of any failure in MCU, MCU2 becomes master. MCU performs all control related calculations on the basis of data received from CCU and

data read through digital inputs and analog inputs for that particular basic unit. All the control related calculation for MC are done by MCU and it is communicated to other control systems such as TIC & LIC (control computers of Traction Converter) through dual redundant CAN communication for final action. This is available in each MC coach of each basic unit. Normally MCU is responsible for EP Brake control, door control, RMPU control of corresponding coach. MCUR will take over control function only when MCU is not healthy.

14.1.5 Main Control Unit _ Redundant (MCUR)

MCUR is located in MC coach. MCUR is redundant system to MCU. All the braking and passenger comfort related functions are done by MCUR in case of failure of MCU.

14.1.6 Passenger Comfort Unit (PCU)

PCU2 is provided in DTC, NDTC and TC coaches with 100% Redundancy. PCU system will be responsible for controlling all passenger comfort related functions in the Train 18 EMU rake mainly, coach lighting, RMPU control, door control. In addition to this, PCU will also control change-over contactors of Auxiliary Power Supply (coach to coach change-over contactors used when one Auxiliary Converter fails), Main compressor & parking brake as per the commands received from CCU through ETB and ECN.

PCU also controls compressor and parking brake. PCU in TC coach controls VCB and pantograph, in addition to

the function done by PCU of DTC/ NDTC. It monitors various power transformer related parameters such as flow, pressure, temperature and controls cooling blowers. PCU is located in DTC/ TC/ NDTC coach and is responsible for passenger related load control of that coach.

14.2 TCMS Redundancy Concept

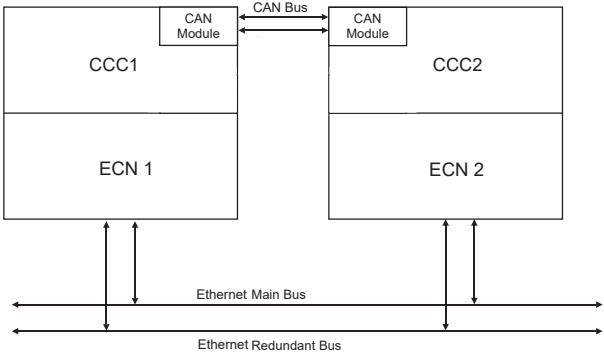

Fig 14.3 CCU interconnection Diagram

14.2.1 Redundancy in CCU

Each DTC of EMU train will consist of two CCUs; each CCU acting as the redundant system in-case of failure of the other CCU.

All Inputs and outputs connection are exactly same for both CCU. So all critical inputs required for train control

such as master controller TE/BE%, various master controller position such as Key-ON, RDM, drive, brake, coast, forward, reverse, emergency brake are completely duplicated in both CCUs. In addition to this all train related commands such as Pantograph control, VCB control, parking brake control, light and RMPU control, ventilation Control are also duplicated in both the CCUs.

The train is controlled by either one of the CCUs called the Master CCU based on Cab Occupation and Health of the CCU (If both CCUs of occupied cab are healthy, priority is given to CCU with lower Serial No.) and the other healthy CCU of the same DTC will become Active-standby CCU and will do all the control calculations but doesn't send control data to EPCUs of different basic unit for final control.

The two CCUs in non occupied coach will work as slave CCU after ETB Inauguration and these slave CCUs only monitor the inputs and update them to the master CCU.

- Two CCUs of same cab communicate with each other and exchange their health status via two ECN channels. So each CCU knows the exact health status of the other CCU. In addition to this, CCUs also exchanges all digital inputs status read along with their health & master controller TE/BE % through dual redundant CAN communication. So in case of input channel failure or input card failure, corresponding channel status can be taken from healthy CCU. Similarly in case of failure or wrong reading of master controller TE/BE% by any CCU, same can be

corrected by value read through ECN communication from other CCU.

- If there is any critical failure in Master CCU and it detects that the Active-standby CCU is healthy, then Master CCU relinquishes its mastership, and hence Active-standby CCU of same occupied cab will become master.

14.3 Frequency Generator

One frequency generator is provided in each DTC. Frequency generator is interfaced with Master-Controller for reading TE/ BE%. Frequency generator reads TE/BE% in terms of analog value (voltage/ current) and converts them into equivalent frequency. This frequency is distributed train wide through train Line. TE/ BE% frequency will be used by CCU, MCU and MCUR under different failure cases for TE/ BE % demand calculation & train control.

14.4 Redundancy for PCUs

Unit level redundancy is provided for PCUs in TC, DTC and NDTC coach. All the functions are executed by redundant PCU in case of main PCU is fails.

14.5 Redundancy in Master Controller Interface

There are two nos of independent potentiometers provided inside master controller to read TE/ BE%. One potentiometer is connected to CCU1, 2nd potentiometer is

connected to potentiometer is connected to frequency generator for determination of TE/ BE% independently.

In addition to above, frequency generator output is connected to CCUs also. In case of failure of any potentiometer or processing circuit of any CCU, correct TE/ BE% can be determined by TE/ BE% read from other CCU and frequency input read from frequency generator.

For determining drive, brake, coast and emergency Brake position 6 NO and 6 NC contacts are provided. These contacts are connected to CCU1 and CCU2. In case of misbehavior of any one input, exact state can be derived from combination of other contacts.

Similarly for key switch ON/ OFF, forward/ reverse and redundant contacts are provided for interfacing with CCU1 and 2 of any DTC. So misbehavior of any one input will not lead to failure.

Even when Train Communication Network (ECN) fails completely (or partially for one or more Motor Coaches), individual MCUs (without ECN access to CCU) can continue to work based on the frequency generator output. In this mode (special RDM mode) of operation, overall train level control functions will not be possible for coaches which do not have ECN communication, however they can directly interpret frequency generator output and derive their motoring and braking commands.

When all possibility of normal operation fails (including ECN and frequency generator), then rescue drive mode facility is available, whereby all motor coaches can be

controlled using hard-wired train line wires instead of train communication network. In this mode train line wires can only command motoring / braking and same will be applied at prior configured TE/BE rates by individual motor coaches with overall speed restrictions.

14.6 Redundancy ETCN communication

For communication between control systems of different basic units dual redundant ETB communication is provided. Both medium of ETB network carries the same information on network. In case of failure of any one medium or noise on any one medium, transition to healthy medium is done automatically without loss of data.

For communication between different control systems inside basic unit, dual redundant ECN communication is provided. Both medium of ECN network carries the same information on network. In case of failure of any one medium or noise on any one medium,transition to healthy medium is done automatically without any loss of data.

14.7 Redundancy in communication with LTC unit

Redundant CAN communication is provided between MCU and Line converter and Traction Converter (LTC) control unit for transfer of various traction & control related commands. In case of failure of any one medium or noise on any one medium, transition to healthy medium is done without any loss of data.

14.8 Hard wired Train Line wires

In addition to control data exchange through redundant ETB/ ECN communication, hard-wired train lines are maintained for all essential control signals such as drive, brake coast, forward, reverse, TE/ BE% frequency, emergency brake loop, brake release loop, emergency off loop, VCB and pantograph control line etc.

During normal mode of operation, data is taken from ECN control packet. In case of rescue drive mode (RDM), train line status are used for train movement with limited features.

14.9 Redundancy for MCUs

Unit level redundancy is provided for MCUs in MC coach. All the functions (i.e. passenger comfort related functions like door control, RMPU control, brake control with EBCU) are executed by redundant MCU, in case of main MCU is failure

Chapter 15

FAILURE MODES WITHIN TCMS SUB SYSTEMS

S.No	Sub system	Module/ Failure	Effect on Train Operation	Redundancy Operation
1	CCU	Digital Input card channel failure	No effect on EMU operation	No need to change the CCU mastership. Channel fault can be identified through fault diagnostic. Faulty channel status can be taken from healthy CCU of same cab through ECN communication. Both CCUs exchange digital inputs, digital outputs & analog input status along with their respective health status through ECN communication periodically.
2	CCU	Digital Input card failure	No effect on EMU operation	No need to change the CCU mastership. Channel fault can be identified through fault diagnostic. Faulty channel status can be taken from healthy CCU of same cab through ECN communication. Both CCUs exchange digital input, digital output & analog input status along with their respective health status through ECN communication periodically.

S.No	Sub system	Module/ Failure	Effect on Train Operation	Redundancy Operation
3	CCU	Digital Output card failure	No effect on EMU operation	CCC2 Takes over mastership to drive outputs
4	CCU	TE/ BE Analog input failure	No effect on EMU operation & TE/ BE% can be deduced correctly	No need to change the CCU mastership. CCC2 also monitors TE/BE frequency and the same will be communicated to CCC1 through ECN communication.
5	CCU	TE/BE frequency input failure	No effect on EMU operation & TE/BE% can be deduced correctly	No need to change the CCU mastership. CCC2 also monitors TE/BE frequency and the same will be communicated to CCC1 through ECN communication.
6	CCU	One ETB channel/ cable failure	No effect on EMU operation	No need to change the CCU mastership. System can run on healthy ETB network and all control & status data exchange can happen normally.
7	CCU	One CCU failure/ one power supply failure	No effect on EMU operation	Healthy CCU of same occupied cab will detect the failure of other CCU when it does not get any heartbeat through ECN communication. With this healthy CCU of occupied cab will become master & controls the train without any deterioration.

S.No	Sub system	Module/ Failure	Effect on Train Operation	Redundancy Operation
8	CCU	Both CCU of occupied cab fail	in occupied cab driving is not possible due to non avialability of VCD functionality	MCU & MCUR will start working on train line. Train can be run in RDM mode (fixed TE/BE) or Special RDM mode (TE/BE still controlled by Master Controller).
9	MCU	Digital Input card channel failure	No effect on EMU operation	No master ship change over. All the DIP data is exchanged between MCU1 and MCU2.
10	MCU	Digital Input card failure	No effect on EMU operation	No master ship change over. All the DIP data is exchanged between MCU1 and MCU2.
11	MCU	Digital output channel failure	No effect on EMU Operation	No mastership change over will happen,Redundant unit will drive the same outputs in parallel
12	MCU	One ETB cable failure	No effect on EMU operation	MCU will keep receiving control data through healthy ETB cable.
13	MCU	MCU control card failure	Traction Will not occur	Mastership changeover to MCU2. All the functions are executed by MCU2
14	MCU	MCU analog input channel failure related to EP brake	No effect on EMU operation. Traction & all braking can happen normally	No mastership changeover. All the analog IO data is ecxhanged between MCU1 and MCU2.
15	MCU	CAN comm fail between MCU and LTC	No effect on EMU operation	No mastership change over. All the traction related functions are exicuted with redundant CAN communication.
16	MCU	Both CAN comm fail between MCU and LTC	No effect on EMU operation	Traction Will not occur for that MC coach, Overall TE Force will reduce.

S.No	Sub system	Module/ Failure	Effect on Train Operation	Redundancy Operation
17	MCU	MCU analog input failure related to load weighing system	No effect on EMU operation.	Load weighing sensors are redundant & connected to MCUR also. MCU will receive weight information & spring deflection information from MCUR through ECN communication.
18	MCU	Frequency input failure for TE/BE%	No effect on EMU operation. Traction & all braking can happen normally	All functionality can be achieved in Normal & RDM mode of operation.
19	MCU	One ECN cable failure	No effect on EMU operation.	Through redundant ECN communication MCC gets commands from CCC and MCC sends status data to CCUs.
20	MCU	Both ECN cable failure or TCN card failure	Traction Will not occur for that MC coach,Overall TE Force will reduce.	Traction Will not occur for that MC coach, Overall TE Force will reduce.
21	PCU	Digital Input card card failure	No effect on passenger comfort functions	Faulty channel health will be detected by fault diagnostic. Failed digital input status will be ignored & will be driven to default state. All passenger comfort functions, Main Air compressor & parking brake work as per the command received from MCU through ECN.
22	PCU	Digital Input card failure	No effect on passenger comfort functions	No mastership change over. All DIP data is exchanged between PCU1 and PCU2.

S.No	Sub system	Module/ Failure	Effect on Train Operation	Redundancy Operation
23	PCU	Digital output channel failure	No effect on EMU Operation.	No mastership change over will happen,Redundant unit will drive the same outputs in parallel
24	PCU	PCU analog input channel failure related to Load sensor	No effect on load measurement & spring deflection.	As per current scheme of MRVC phase II, if two pressure sensors are provided per bogie, it can be connected to two different analog inputs. So failure of one analog input will not affect load measurement & spring deflection measurement.
25	PCU	One ECN channel/ cable failure	No effect on passenger related load operations	PCU will automatically switchover to redundant ECN network. All passenger comfort functions, Main Air compressor & parking brake work as per the command received from MCU through ECN.
26	PCU	Both ECN channels / cable failure or card failure	No effect on EMU operation.	Mastership will switch over to PCU2
27	PCU	PCU control card failure/ power supply failure	No effect on EMU operation.	Mastership will switch over to PCU2
28	DDU	One ECN cable failure	No effect on EMU operation	DDU is connected to both ECNs in DTC coach. All the functions will done through redundunt cable.
29	ACU	One ECN cable failure	No effect on EMU operation	ACU is connected to both ECNs in MC coach. All the functions will done through redundunt cable.

S.No	Sub system	Module/ Failure	Effect on Train Operation	Redundancy Operation
30	ERMS	One ECN cable failure	No effect on EMU operation	ERMS is connected to both ECNs in DTC1 coach. All the functions will done through redundunt cable.
31	ECN-DTC	ECN switch failure	No effect on EMU operation	All the functions are exicuted with redundant ECN switch.
32	ECN-MC	ECN switch failure	No effect on EMU operation	All the functions are exicuted with redundant ECN switch.
33	ECN-TC	ECN switch failure	No effect on EMU operation	All the functions are exicuted with redundant ECN switch.
34	ECN-NDTC	ECN switch failure	No effect on EMU operation	All the functions are exicuted with redundant ECN switch.
35	ECN-TC1	ECN switch failure	No effect on EMU operation	All the functions are exicuted with redundant ECN switch.

Chapter 16

KEY INTERLOCKING SYSTEM

Purpose of key interlocking system is to prevent staff from accidental working with line voltage equipment without grounding the line voltage components. The general idea of the key interlocking system is based on the principle that, a number of safety actions be carried out in the correct order and every action performed properly releases a key, that is used in the next action until the high voltage under slung converter cubicles doors are safely opened for inspection and maintenance work. The high voltage equipment i.e, pantograph, line circuit breaker, earthing switch are directly or indirectly part of the key interlocking system.

Step 1: Down the pantograph by operating the deactivation switch in driver's cab.

Step 2: Ground LCB with the earthing switch. The blue Key – A from the pantograph air isolating cock is inserted into the lock of the earthing switch and the operating handle of the earthing switch is turned to earth position.

Step 3: The yellow Key – B from the earthing switch removed after grounding LCB is inserted in DC link earthing switch unit. The DC link Earthing switch unit is common for both LHS and RHS LTC units. DC link earth switch is operated to the earth position to ground the DC link. It is however recommended to wait for 5 minutes until the capacitors become discharged through the bleeder resistors/ discharging resistors after the pantograph is lowered.

Step 4: The released Green key from the DC link earthing switch can be used to open either the LHS or RHS LTC unit doors.

16.1 Convert the vehicle to RDM

When TCN failure lamp becomes ON and/ or event no 12324/ 14372 is active (TCN failure rake runs in special RDM mode, if rake is unable to run or move the key to RDM position) and/ or rake is unable to run in normal mode, move the key to RDM position.

- To use this mode, rake should be run to clear the section.
- In this mode, speed is restricted to kmph
- Driver display unit may not function.

Chapter 17

PIS

17.1 Introduction

PIS comprises Head Code Display (HCD), Man Machine Interface (MMI), Car Control (CC), Ambient Noise Measurement (ANM), speakers, and microphone.

Passenger information system for Train-18 gives required information to the passengers in a train throughout the journey in both visual and audio form. System has a provision for public announcement, where driver can address all the passengers in the train. It also has a provision for Inter Communication (IC) between driver and guard.

PIS is employed in Train-18 to provide the information like train route, next arriving station, current station, and safety messages to passengers in both visual and audio form. Along with the above information, it also displays current time in the in-coach (DSD) displays. It also provides intercommunication between driver in front cab and guard in the end cab. The main aim of this system is to provide convenience to the passengers by providing station information and other required information.

17.2 List of Abbreviations used

S.No	Acronym	Description
1	ANM	Ambient Noise Measurement
2	CC	Car Control
3	CAN	Controller Area Network
4	DTC	Driving Trailer Coach
5	EBU	End Basic Unit
6	GPS	Global Positing System
7	HCD	Head Code Display
8	IC	Inter-Communication
9	LED	Light Emitting Diode
10	MBU	Middle Basic Unit
11	MC	Motor Coach
12	MMI	Man Machine Interface
13	NDTC	Non-Driving Trailer Coach
14	PA	Public Address
15	PECU	Passenger Emergency Communication Unit
16	PIS	Passenger Information System
17	SDBD	Side Destination Board Display
18	SSD	Single Side Display
19	TC	Trailer Coach
20	TR	Train Radio

17.3 System Overview

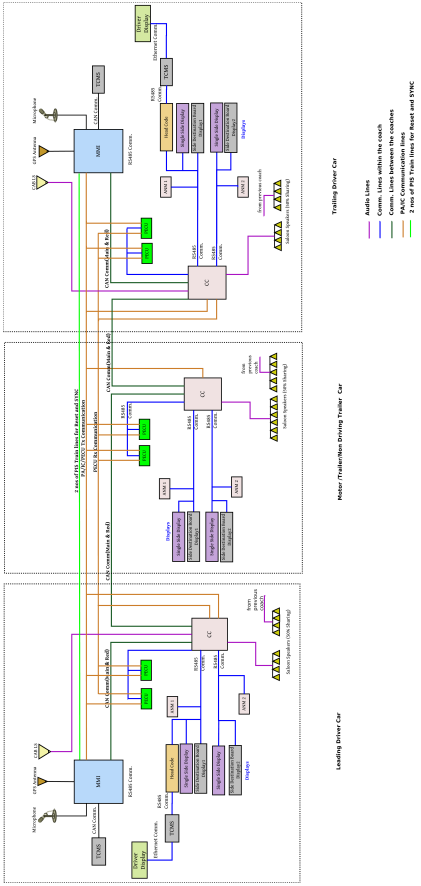

Fig 17.1

1. MMIs and CCs in leading coaches are interfaced using CAN network.
2. One MMI in the trailing coach behaves as master and other MMI behaves as slave, based on the direction of journey.
3. CC acts as local master and interfaces with all the display boards, ANMs, and PECUs through RS485 communication network, using two channels for redundancy.
4. The leading and trailing coaches consist of Man Machine Interface (MMI) with GPS antenna, head code display, one Car Control unit (CC) with in built audio amplifier, two SSDs, two SDBDs, two ANMs, two PECUs, one cab loud speaker, eight saloon speakers, and one microphone.
5. All other coaches contain two DSDs, one CC unit with built in audio amplifier, two ANMs, four ETBs, and four loud speakers.
6. All other coaches other than leading and trailing coaches contain one Car Control (CC) with built in audio amplifier unit, two SSDs, two SDBDs, two ANMs, two PECUs, and eleven saloon speakers.
7. Speaker of 6 watt R.M.S. rating is provided with 50% of sharing, in case of single power amplifier failure in CC unit. Therefore at least half of the speakers would be still operative in the coach.

8. Public addressing system is provided to enable communication between guard and passenger.
9. Inter-comm is provided to enable communication between driver and guard.
10. Whenever emergency talk back unit is pressed, information is displayed to driver/ guard through MMI. Passenger can talk to driver/ guard using passenger emergency communication unit.
11. One train line provides common hard reset to entire PIS system.
12. MMI unit is interfaced to CCTV display unit through RS-485 communication to enable nearby camera views, when PECU is operated while emergency.

17.4 Scope of Supply and Location of each equipment in coach

S.No	Sub-system	Scope of Supply	DTC (2)	MC (8)	TC (4)	NDTC (2)	16-car Total
1	Microphone	Medha	1	X	X	X	2
2	Cab Loudspeaker	Medha	1	X	X	X	2
3	Head Code unit (HCD)	Medha	1	X	X	X	2
4	Man Machine Interface (MMI)	Medha	1	X	X	X	2
5	GPS Antenna	Medha	1	X	X	X	2
6	Car Control (CC)	Medha	1	1	1	1	16
7	Saloon Loudspeaker	Medha	8	11	11	11	170

S.No	Sub-system	Scope of Supply	DTC (2)	MC (8)	TC (4)	NDTC (2)	16-car Total
8	Ambient Noise Measurement (ANM)	Medha	2	2	2	2	32
9	In Coach Displays (SSD)	Medha	2	2	2	2	32
10	Passenger Emergency Communication unit (PECU)	Medha	2	2	2	2	32
11	Side Destination Board Display (SDBD)	Medha	2	2	2	2	32

Location of each equipment in coach

S.No	Sub-system	DTC (2)	MC (8)	TC (4)	NDTC (2)
1	Microphone	Driver Desk	X	X	X
2	Cab Loudspeaker	Driver cab roof	X	X	X
3	Head Code	Driver Cab front top side	X	X	X
4	Man Machine Interface (MMI)	Driver Desk	X	X	X
5	GPS Antenna	Driver Desk	X	X	X
6	Car Control (CC)	GCRW	ECC	ECC	ECC
7	Saloon Loudspeaker	Roof	Roof	Roof	Roof
8	Ambient Noise Measurement (ANM)	Roof	Roof	Roof	Roof
9	In Coach Displays (SSD)	Wall mouting	Wall	Wall mouting	Wall mouting

11	Side Destination Board Display (SDBD)	Middle of the Coach outside	Middle of the Coach outside	Middle of the Coach outside	Middle of the Coach outside

17.4.1 Man Machine Interface (MMI)

Man machine interface is an user friendly module, which consists of 20x4 backlit alphanumeric (English) LCD display with 21 button keypad, that includes 12 alphanumeric keys, two up/ down keys for volume control/ platform direction keys/ menu surfing keys, and remaining are functional keys, for user interface. This module, which is mounted on the driver desk is mainly used for configuration and displaying the menu options, system status, and route information to user (Driver/ Guard). User can know the status of each sub system from MMI. User can enable PA, IC, TR communication, using the keys provided on the keyboard. It has three indication LEDs (PA, IC,TR), which displays the audio communication enable/ disable status. MMI takes care of all operations such as train route simulation using GPS and fault diagnostic of the complete PIS system. Train route database of PIS system is stored in MMI.

17.4.2 Car Control Unit (CC) :

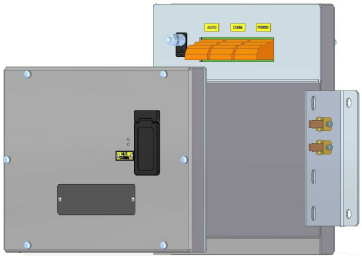

Fig 17.2

Car controller, which acts as local master is the main system to control and command all sub systems in particular coach. Upon receipt of train route from MMI, CC transfers the required information to all display units to display the train route. On receipt of station triggers from MMI, CC will transfer arrival and departure information to in-coach displays and audio data to the speakers. All sub systems in a coach like head code display, double side display, side destination board display, and ambient noise measurement unit are connected through RS485 to car controller unit. It also monitors the health of all sub systems, which are under its control and exchanges the data with MMI for central data storage. Speakers are routed from CC in coach by 50% audio sharing through two channels.

17.4.3 Head Code Display (HCD)

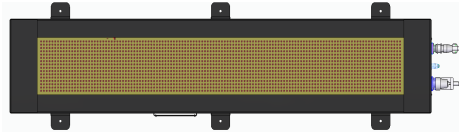

Fig 17.3

Head code, which is provided at front end of the driving coach (leading and trailing), above the lookout glass display, consists of LED boards. LED matrix size is 16x128.

HCD displays:

1. Train number
2. Name of destination station in english, hindi and regional language.

In case of communication failure between car control and head code, driver/ guard can manually select the train route through TCMS display unit located in driver/ guard cabin.

17.4.4 Side Destination Board Display (SDBD)

Fig 17.4

Side destination board display system is provided on each side of the coach. It displays the information in two parts. In one part, coach number and train number is displayed. In second part, train name and source to destination is displayed in english, hindi, and regional languages. Matrix size: 16x128.

Side destination board display system displays:

1. Train number
2. Coach number
3. Train name
4. Source to destination
5. Text messages in english, hindi, and regional languages.

17.4.5 In-Coach Display unit (Single Side Display)

In-coach display unit consists of multi color LED boards (16X144). ICD displays the route related information of present station and next station to the passengers throughout the journey. In addition to the route related

data, ICD also displays the safety messages upon receiving triggers from CC.

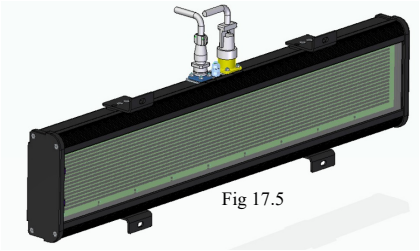

Fig 17.5

17.4.6 Ambient Noise Measurement (ANM) unit

ANM is a noise measurement module, which consists of a microphone. It detects the background noise and measures the noise level and sends the same to CC. CC will adjust the volume level of saloon speakers, based on the background noise received from ANM.

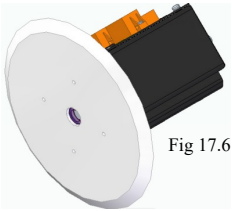

Fig 17.6

17.4.7 Speakers

Speakers of 6 watt R.M.S. rating are provided. 50% of

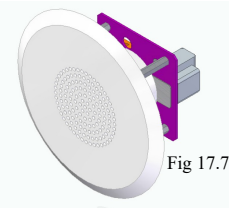

Fig 17.7

sharing is provided for the speakers, in case of single power amplifier failure in CC unit. Therefore atleast half of the speakers will be still operative in the coach.

17.4.8 Passenger Emergency Communication Unit (PECU)

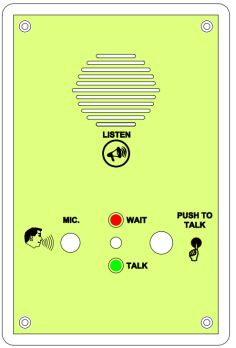

Fig 17.8

Passenger emergency communication unit provides the emergency communication between driver/ guard and passengers. When a passenger emergency communication unit is operated by passenger in any particular coach, an indication is given to the driver/ guard on MMI screen. Driver/ guard will acknowledge PECU request in MMI to enable the communication with passenger. PECU contains a switch to press, in case of emergency. When user presses the switch, information will be transferred to CC unit through RS485 communication. In-turn the information is posted to MMI through CAN communication. Audio processing circuit takes the microphone audio signal from PECU as input and generates differential audio signal and also takes the audio output signal from microphone interfaced with MMI and amplifies the signal, which is delivered as audio to the passenger.

17.4.9 GPS Antenna

A rugged GPS antenna with anti-theft protection of required cable length is provided for use on rail vehicles.

17.6 Power up initialization

After power ON, MMI displays a screen as shown in Fig 17.12 and Fig 17.13.

Cab 1 MMI Shows :

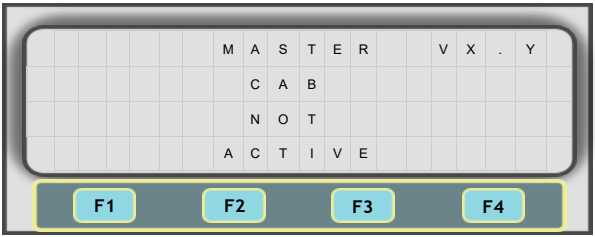

Fig 17.12

Cab 2 MMI Shows :

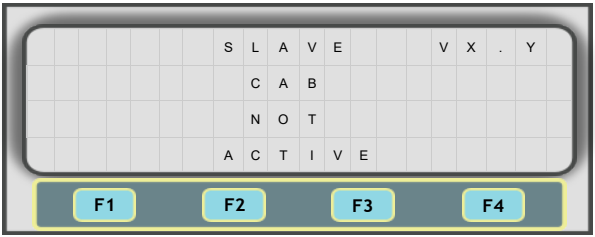

Fig 17.13

17.6.1 PIS Master ship :

Long press ‘Enter’ key on MMI of Cab1. Master MMI screen appears as shown in Fig 17.14.

Cab 1 MMI Shows :

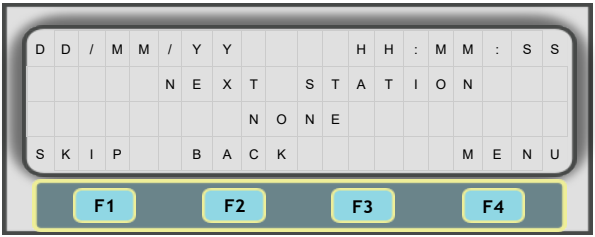

Fig 17.14

- Row 1 → Displays GPS date and time/ GPS signal status.

If GPS signal is good, then it displays date and time. If GPS signal is poor, it displays a text “GPS signal poor” on LCD screen.

- Row 2 → Displays present/ next station based on the train position and distance traveled
- Row 3 → Displays ‘None’ in default condition, when journey is not selected and displays the station ID, if journey is selected
- Row 4 → Displays Menu screen access options

Other Cab2 MMI unit becomes slave and MMI screen appears as shown in Fig 17.15.

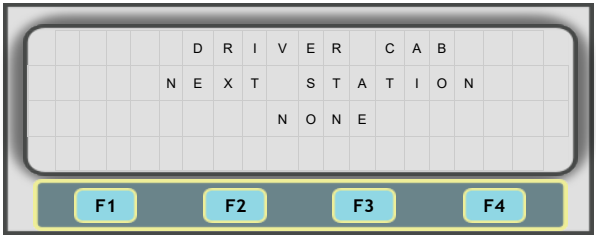

Fig 17.15

- Row 1 → Displays cab details
- Row 2 → Displays present/ next station based on the train position and distance traveled
- Row 3 → Displays “None” in default condition, when journey is not selected and displays station ID, if journey is selected.

17.6.2 Journey selection procedure

Once MMI takes the master ship, it displays default menu screen as shown in Fig 17.16.

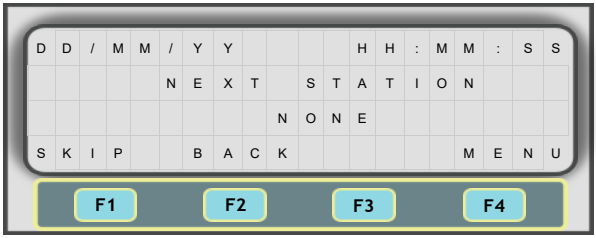

Fig 17.16

By pressing F4, MMI displays the menu screen as shown in Fig 17.17.

Fig 17.17

Press ‘F4’ to enter the journey details. MMI displays a screen shown in Fig 17.18.

Fig 17.18

Enter journey number using alphanumeric keypad, provided on MMI unit. After entering the journey number, press ‘F4’ to confirm. ‘F1’ acts as cancel key. If a wrong number is entered, press ‘F1’ to cancel.

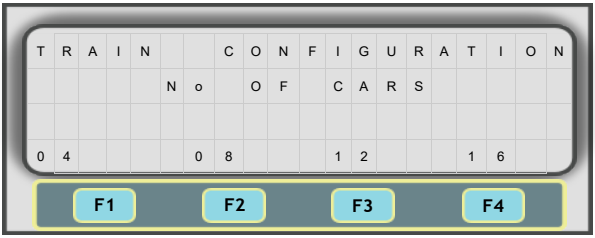

Fig 17.19

Press ‘F4’ to confirm the train configuration as 16 car.

Fig 17.20

If entered journey number is not available in MMI, MMI displays a screen shown in Fig 17.21.

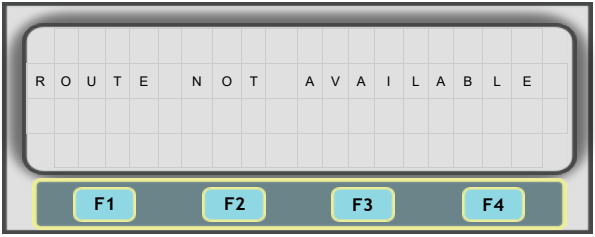

Fig 17.21

If entered journey number is available in MMI, screen displays a message, as shown in Fig 17.22.

Fig 17.22

After confirmation screen, MMI displays journey information as shown in Fig 17.23 and 17.24.

17.7 Public Address

Driver/ Guard can enable the public address to make announcements to the passengers.

STEP	ACTION	
1	Check initial condition	MMI of Cab 1 shows:  MMI of Cab 2 shows: 2	Press PA button on MMI Keypad	MMI of Cab 1 shows:  MMI of Cab 2 shows: 
STEP	ACTION	
4	Speak through Cab 1 of MMI Microphone.	Voice shall be heard from other end cab and Saloon loudspeakers
5	Speak through Cab 2 of MMI Microphone.	No voice shall be heard from Cab and Saloon loudspeakers
6	Press 'PA' button on the MMI keypad	MMI of Cab 2 shows: 7	Press 'PA' button again on the MMI keypad	MMI of Cab 1 shows:  MMI of Cab 2 shows: 
STEP	ACTION	
8	Disable 'PA' operation. Both MMI and PA indication LEDs go Off.	MMI of Cab 1 shows:  MMI of Cab 2 shows: 9	Speak through Microphone of Cab 1 and Cab 2	No Voice shall be heard from Cab and Saloon loudspeakers

NOTE

- Only initiator can disable the Public Addressing (PA).
- When non-initiator tries to disable PA, MMI doesnot allow to disable and displays a message, “Disable from Other cab”.

17.7.1 Inter Communication:

Procedure to enable inter communication between driver and guard during journey is as follows.

STEP	ACTION	
1	Check initial condition	MMI of Cab 1 shows:  MMI of Cab 2 shows: 
2	Press ‘IC’ button on the MMI keypad of Cab 1. Both MMI IC indication LEDs starts blinking and jingle sound shall be heared from both cab loudspeakers.	MMI of Cab 1 shows:  MMI of Cab 2 shows: 

STEP	ACTION	
3	Press ‘IC’ button on the MMI keypad of Cab 2. Both MMI IC indication LEDs will be ON continuously.	MMI of Cab 1 shows:  MMI of Cab 2 shows: 
4	During IC calling	MMI of Cab 1 shows:  MMI of Cab 2 shows: 

STEP	ACTION	
5	Speak through Master MMI Microphone.	Voice shall be heard from Cab-2 loudspeaker.
6	Speak through Slave MMI Microphone.	Voice shall be heard from Cab-1 loudspeaker.
7	Press 'IC' Button on the MMI Keypad of Cab 2	MMI of Cab 1 shows: 8	Again press the 'IC' button on the MMI keypad of Cab 1	MMI of Cab 1 shows:  MMI of Cab 2 shows: 

STEP	ACTION	
9	After disabling the IC operation, both MMI keypad IC indication LEDs go OFF.	MMI of Cab 1 shows:  MMI of Cab 2 shows: 10	Speak through Microphone of Cab 1 and Cab 2	No Voice shall be heard from any of the Cab loudspeakers

NOTE

- Only initiator can disable the Inter-communication (IC).
- When non-initiator tries to disable the inter-communication, MMI does not allows to disable IC and displays a message “Disable from Other cab”.

17.7.2 PECU (Guard-Passenger Communication)

Procedure to enable PECU call between guard and passenger during journey is as follows

STEP	ACTION	
1	Check initial condition in PECU. Indication LED blinks continuously in red color and push button LED shall be in OFF condition.	MMI of Cab 1 shows:  MMI of Cab 2 shows: 2	Press PECU call button on the PECU of any coach. PECU indication LED glows continuously in RED color and PECU push button LED shall be in ON condition.	The MMI of Cab 1 shows:  Once PECU call request is received, MMI displays CC number and PECU number. The MMI of Cab 2 shows: 

STEP	ACTION	
3	Press 'F4' button on MMI keypad of Cab 1. PECU indication LED color changes from red to green and push button LED will be continuously ON.	MMI of Cab 1 shows:  After displaying confirmation message, MMI displays the following screen  MMI of Cab 2 shows: 
4	Speak through CAB1 microphone and observe voice at PECU	Voice shall be heard from PECU speaker
5	Speak through PECU microphone and observe voice at CAB1 loudspeaker	Voice shall be heard from CAB1 loudspeaker

STEP	ACTION	
6	Press 'F4' button on MMI keypad of Cab 1. PECU indication LED color changes from red to green and push button LED will be continuously ON.	MMI of Cab 1 shows:  After displaying confirmation message, MMI displays the following screen  MMI of Cab 2 shows: 
Rejecting PECU call during journey is explained in the below table		

STEP	ACTION	
7	Press PECU call button on the PECU of any coach. PECU indication LED glows continuously in RED color. PECU push button LED will be ON.	MMI of Cab 1 shows:  Once PECU call request is received, MMI displays CC number and PECU number. MMI of Cab 2 shows: 
8	Press 'F1' button on MMI keypad of Cab 1. PECU indication LED starts blinking and push button LED goes OFF.	MMI of Cab 1 shows:  After confirmation message, MMI displays default screen 

STEP	ACTION	
		The MMI of Cab 2 shows: 
NOTE

- PECU call can be enabled/ disabled only by guard (MMI-Master)
- At a time, only one call will be established.
- PECU call will be served based on first in-first out.
- During one PECU call, other call will be maintained in queue.

17.7.3 Route De-Selection

To deselect the train route, long press key 'ESC' on MMI keypad for 5 seconds. All the devices of PIS system gets reset.

After deselecting train route, MMI displays a screen as shown in Fig 17.25.

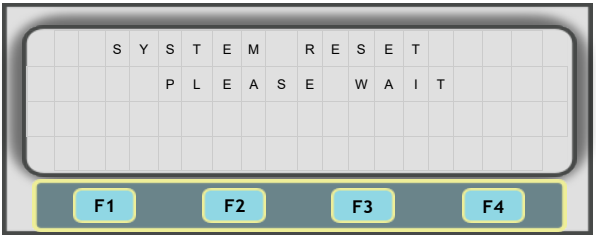

Fig 17.25

Cab 1 MMI Shows :

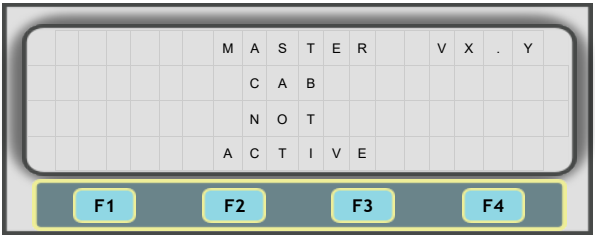

Fig 17.26

Cab 2 MMI Shows :

Fig 17.27

17.8 Menu Screen Operations

After inserting master key, other end of MMI becomes master and displays menu for accessing PA/ PIS system in offline.

17.8.1 Messages :

Messages option is used to display required message to all the passengers inside the coaches. It can be a welcome message, safety message, or wishes.

By selecting 'Messages' option, MMI displays a screen as shown in Fig 17.28.

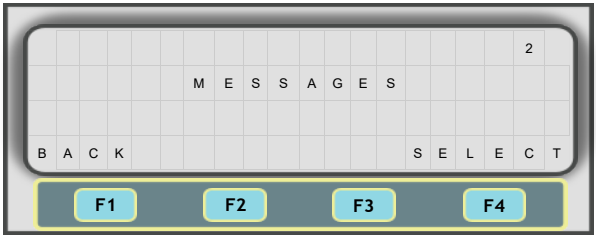

Fig 17.28

Press 'F4' to display the list of messages.

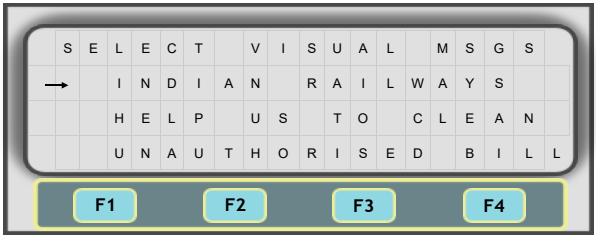

Fig 17.29

User can select the required message using up(🡅) and down(🡇) keys. Selected message will be sent to all CC units and is displayed on internal displays (SSD/ DSD).

Press 'F4' to select the required message.

17.8.2 Announcements :

Announcement option is used to make the audio announcements to all passengers inside the coach. It can be a welcome message, safety message, or wishes.

By selecting 'Announcements' option, MMI displays a screen as shown in Fig 17.30.

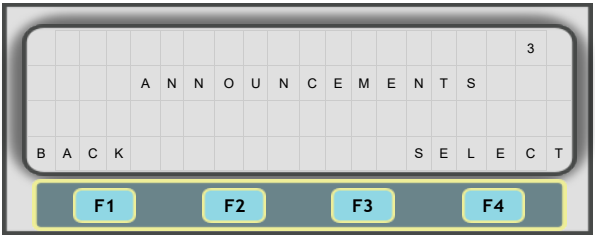

Fig 17.30

Press 'F4' to display the list of messages.

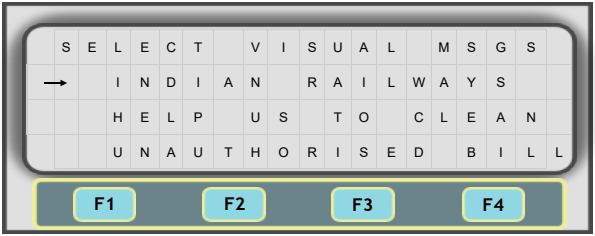

Fig 17.31

User can select the required audio messages using up(↑) and down(↓) keys. Selected audio message will be sent to all CC units and is then announced in the coach area through speakers.

Press 'F4' to select the required message.

17.8.3 Volume Level Selection :

Volume level selection is used to select various volume levels of audio. By selecting 'Volume SLS' option, MMI displays volume levels as shown below.

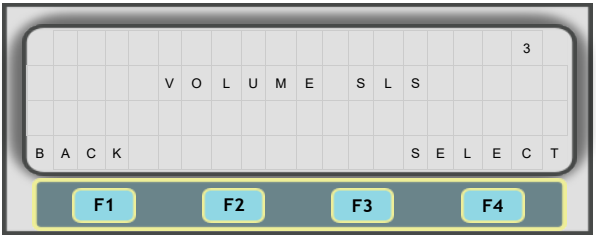

Fig 17.32

User can increase/ decrease the volume level through up (↑) and down (↓) keys. Selected volume level will be sent to all the CC units to configure the volume for journey announcements.

MMI provides volume levels from 1 to 3, where the volume min is '1' and max is '3'.

17.8.4 Platform Direction Selection :

Platform direction selection is used to enable/ disable platform direction. This can be done by selecting:

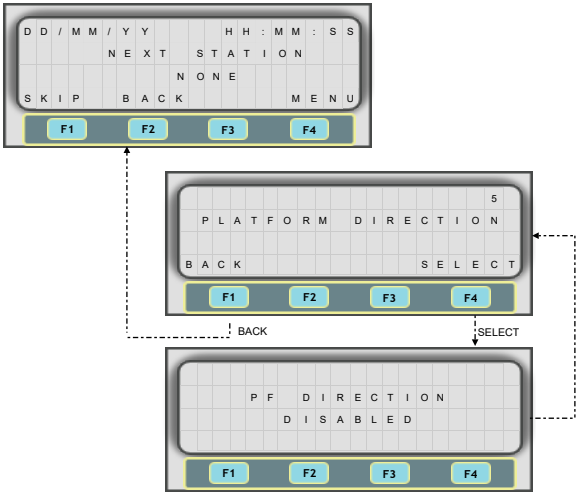

Fig 17.33

17.8.5 Diagnostics :

Diagnostics option is used to verify status of PA/ PIS system with display test, audio test, and CCTV test. By selecting 'Diagnostics' option, MMI displays following menu options.

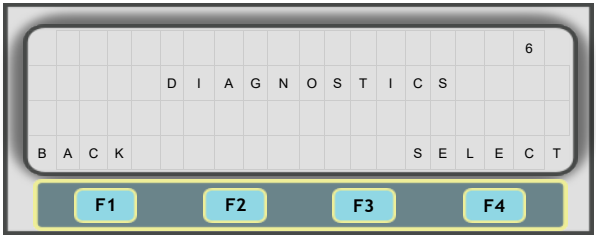

Fig 17.34

By pressing ‘F4’ (Select) button, MMI displays a screen with following options.

Fig 17.35

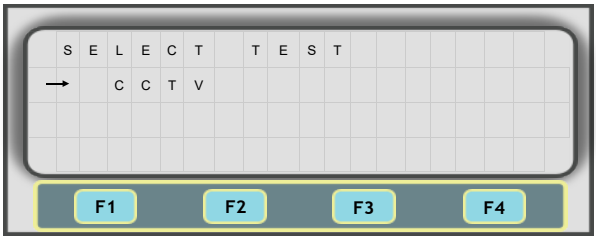

Fig 17.36

User can select the required test condition using up(↑) and down(↓) keys.

17.8.5/a Loud Speaker Test :

By selecting 'Loud Speaker Test', a jingle tone is announced continuously in all the coaches and MMI displays the screen as shown in Fig 17.37.

Fig 17.37

By selecting ‘F1’ (Back) button, MMI displays previous screen (Diagnostics Menu), followed by loudspeaker test. By selecting ‘F4’ (Stop), MMI displays the previous screen (Diagnostics Menu) by terminating the loudspeaker test.

17.8.5/b Display Test :

By selecting 'Display Test', all the LEDs of ICDs, side destination board display, and head code unit glows continuously in all coaches and MMI displays screen as shown in Fig 17.38.

Fig 17.38

By selecting ‘F1’ (back), MMI displays previous screen (Diagnostics Menu), followed by display test. By selecting ‘F4’ (Stop), MMI displays previous screen (Diagnosis Menu), by terminating the display test.

17.8.5/c CCTV :

By pressing ‘F4’ (Select) button in Diagnostics menu (Fig 17.34), MMI displays following options, as shown in Fig 17.39.

Fig 17.39

By using down(🡻) key, CCTV option can be selected.

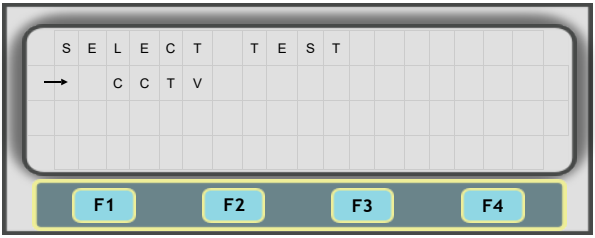

Fig 17.40

By selecting ‘F4’ (Select) button, MMI displays the screen, as shown in Fig 17.41.

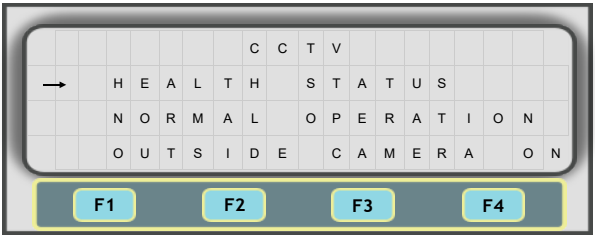

Fig 17.41

User can select the required test condition using up(🡅) and down(🡇) keys.

- **Health Status:**

By selecting the 'Health Status', user can know RS485 communication between MMI and CCTV.

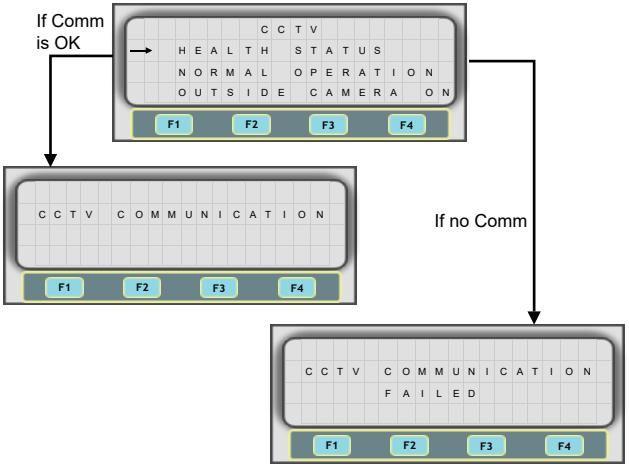

Fig 17.42

- **Normal Operation:**

By selecting 'Normal Operation', CCTV display shows normal camera views and MMI displays the screen as shown in Fig 17.43.

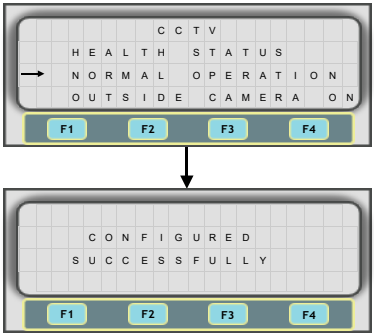

Fig 17.43

- **Outside Camera ON:**

By selecting 'Outside Camera ON', CCTV display shows platform camera views and MMI displays the screen as shown in Fig 17.44.

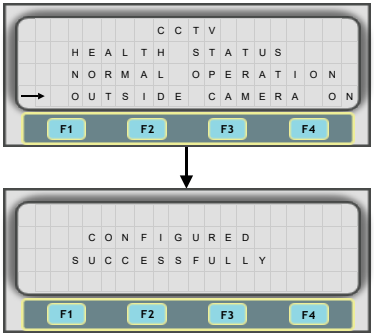

Fig 17.44

17.8.6 Factory Settings:

'Factory settings' option is used to verify the settings of PA/ PIS system with audio volume controlling and test mode operations. By selecting the 'Factory Settings' option, MMI displays the screen, shown in Fig 17.45.

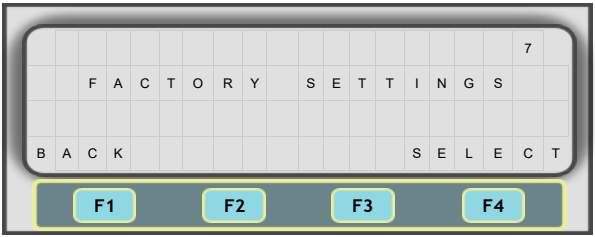

Fig 17.45

By selecting ‘F4’ (Select) button, MMI displays the following options :

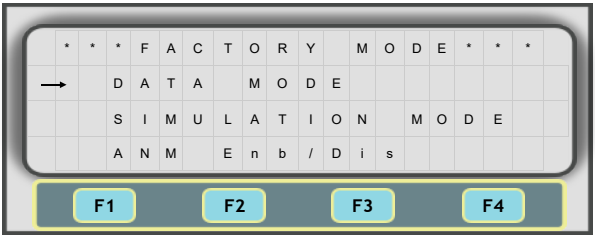

Fig 17.46

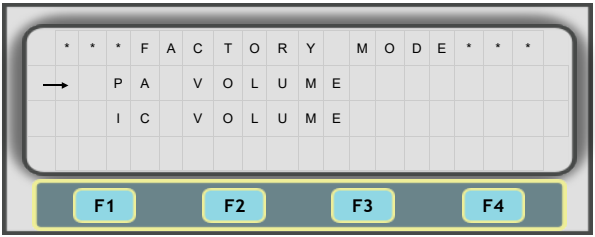

Fig 17.47

User can select the required test condition using up (↑) and down (↓) keys.

17.8.6/a Data Mode :

Data mode is used for communicating master data base and master/ slave configuration, uploading through CAN application tool. By selecting 'Data Mode', a screen appears as shown in Fig 17.48.

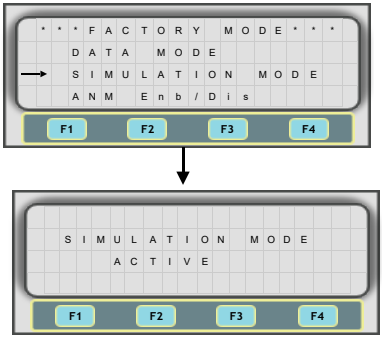

Fig 17.49

17.8.6/c ANM Enb/ Dis :

'ANM Enb/ Dis' option is used for enabling/ disabling ANM controlling with MMI. By selecting 'ANM Enb/Dis', a screen appears as shown in Fig 17.50.

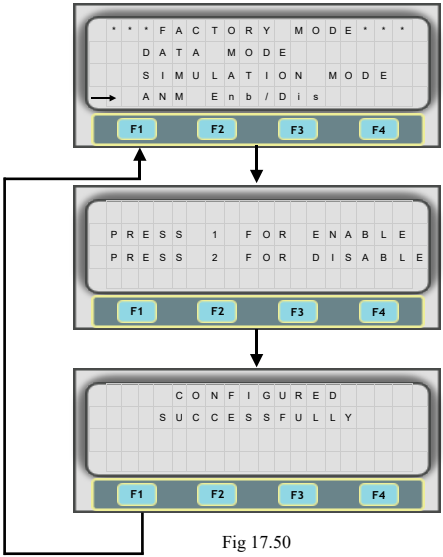

Fig 17.50

17.8.6/d PA Volume:

'PA volume' is used to select various volume levels of audio.

By selecting 'PA Volume', MMI displays the volume levels as follows.

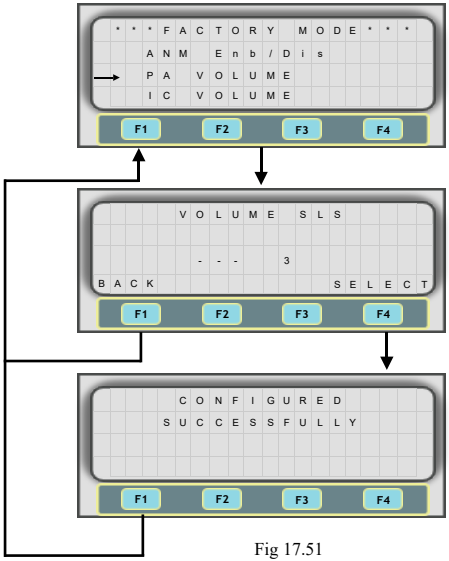

Fig 17.51

User can increase/ decrease the volume level using up(🡅) and down(🡇) keys. Selected volume level will be sent to all CC units to configure the volume for PA.

MMI provides volume levels from 1 to 3, where the volume min is '1' and max is '3'.

17.8.6/e IC Volume:

'IC Volume' option is used to select various volume levels of audio. By selecting 'IC Volume', MMI displays the volume levels as shown in Fig 17.52.
